Landau gauge Euclidean QCD Lagrangian

- Computation of correlation functions analytically requires gauge fixing.
- Euclidean gauge fixed Lagrangian via **Faddeev-Popov** in Landau gauge

$$\mathcal{L} = \frac{1}{4} F_{\mu\nu}^a F_{\mu\nu}^a + \sum_{i=1}^{N_f} \bar{\psi}_i (\gamma_\mu D_\mu + M_i) \psi_i + \underbrace{ih^a \partial_\mu A_\mu^a}_{\text{Landau gauge}} + \underbrace{\partial_\mu \bar{c}^a (D_\mu c)^a}_{\text{Ghosts}}.$$

$$F_{\mu\nu}^a = \partial_\mu A_\nu^a - \partial_\nu A_\mu^a + gf^{abc} A_\mu^b A_\nu^c,$$

$$D_\mu \psi = \partial_\mu \psi - ig A_\mu^a t^a \psi$$

$$(D_\mu c)^a = \partial_\mu c^a + gf^{abc} A_\mu^b c^c.$$

- **Standard** perturbation theory:

- Asymptotic freedom [1973, Politzer, Gross, Wilczek; Nobel prize 2004]
- Landau pole in the infrared

Faddeev-Popov } Perturbation theory

 **Nonperturbative approaches:**

{ fRG [Cyrol, Fister, Mitter, Pawłowsky, Strodthoff ...]

{ Dyson-Schwinger equations [Aguilar, Alkofer, Binosi, Eichmann, Fischer, Huber, Papavassiliou, Roberts ...]

{ nPI, ...

- Lattice simulations in the infrared:
 - moderate coupling constant
 - no evidence for a Landau pole
 - some kind of perturbation theory should be possible

Problems fixing the gauge

- Faddeev-Popov procedure is not completely justified in the infrared.
- Presence of Gribov copies

- Faddeev-Popov procedure is not completely justified in the infrared.
- Presence of Gribov copies

- Faddeev-Popov action needs to be extended or modified
➔ How to find the appropriate gauge-fixed Lagrangian?
 - Studies trying to restrict the integrals to a region without Gribov copies: Gribov-Zwanziger action and refined-Gribov-Zwanziger action.
[Zwanziger (1989), Dudal et al (2008)]
 - **Phenomenological approach:** include new operators to complete the gauge-fixing model and try to constraint their coupling

Lattice simulations:

- Several Gribov copies are found by lattice simulations.
- Fortunately, Lattice simulations are able to choose one Gribov copy for each orbit.

However

The equivalent action in the continuum is not known.

Lattice simulations:

- Several Gribov copies are found by lattice simulations.
- Fortunately, Lattice simulations are able to choose one Gribov copy for each orbit.

However

The equivalent action in the continuum is not known.

- Finite coupling constant.
- Massive gluons and massless ghosts.

[I. L. Bogolubsky, E. M. Ilgenfritz, M. Müller-Preussker, A. Sternbeck, *Phys. Lett. B*676 (2009)]

The model: Massive gluons (Curci-Ferrari)

What is the simplest Lagrangian that allows us to do perturbation theory reproducing lattice results?

- Let's try just adding a gluon mass term:

$$\mathcal{L} = \mathcal{L}_{\text{inv}} + ih^a \partial_\mu A_\mu^a + \partial_\mu \bar{c}^a (D_\mu c)^a + \frac{m^2}{2} \mathbf{A}_\mu^a \mathbf{A}_\mu^a$$

[Curci-Ferrari (1975)]

- This term breaks BRST symmetry.** [Becchi, Rouet, Stora (1975) and Tyutin (1975)]
But it still has a modified-BRST symmetry which allows to prove renormalizability.
- It violates positivity ... but also lattice simulations do

[Cucchieri, Mendes, Taurines Phys.Rev.D71 (2005)].

We would like to check

... if the perturbative analysis reproduces the lattice data

Renormalization Scheme

Infrared safe scheme:

$$\Gamma_{AA}^{(2)}(p = \mu, \mu) = \mu^2 + m(\mu),$$

$$\Gamma_{C\bar{C}}^{(2)}(p = \mu, \mu) = \mu^2,$$

$$Z_g \sqrt{Z_A} Z_c = 1,$$

$$Z_{m^2} Z_A Z_c = 1$$

As a consequence, the gluon and the ghost propagators are given explicitly in terms of the running parameters.

$$D(p) = \frac{g^2(\mu_0)}{m^4(\mu_0)} \frac{m^4(p)}{g^2(p)} \frac{1}{p^2 + m^2(p)}, \quad J(p) = \frac{m^2(\mu_0)}{g^2(\mu_0)} \frac{g^2(p)}{m^2(p)}$$

One loop results within pCF for $SU(2)$ and $d = 4$.

- $d = 4$

Glueon propagator

Ghost dressing function

$$g(1 \text{ GeV}) = 7,5 \text{ and } m(1 \text{ GeV}) = 0,77 \text{ GeV}$$

Lattice data from [A. Cucchieri, A. Maas and T. Mendes, *Phys.Lett. D77*, 2008]. Results from [M. Tissier and N. Wschebor, *Phys.Rev. D84*, 2011]

One loop pCF: Vertices $SU(2)$ and $d = 4$

- Without any extra fitting.

Configurations: gluon vanishing momentum and all equal momenta.

Lattice data from [A. Cucchieri, A. Maas and T. Mendes, *Phys.Lett. D77*, 2008]. Results from [M. Peláez, M. Tissier and N. Wschebor, *Phys.Rev. D88*, 2013]

- The three-gluon vertex diverges as $\log p$ in the infrared.

One loop pCF: alpha strong for $SU(3)$ and $d = 4$.

Fitting the IR

Fitting the UV

Lattice data from [A. G. Duarte, O. Olivera, P.J. Silva, *Phys. Rev D*94, 2016]

Results from [M. Tissier and N. Wschebor, *Phys.Rev. D*84, 2011]

1 Curci-Ferrari model in Landau gauge

2 Preliminary two loop results

3 Quark propagator

4 Conclusions and perspectives

- Two loop diagrams for the ghost propagator

- Two loop diagrams for the gluon propagator

- We use **Laporta algorithm** to decompose the two-loop two-point functions into **master integrals**

$$\Gamma_{AA}^{(2)}(p) = p^2 + m^2 + \sum_{D \in \mathcal{M}} \mathcal{R}_{AA}(D) \mathcal{I}(D)$$

$$\Gamma_{C\bar{C}}^{(2)}(p) = p^2 + \sum_{D \in \mathcal{M}} \mathcal{R}_{C\bar{C}}(D) \mathcal{I}(D)$$

where $\mathcal{R}_{AA}(D)$ and $\mathcal{R}_{C\bar{C}}(D)$ are rational functions of p^2 and m^2 , and $\mathcal{I}(D)$ is a master Feynman integral, with D among

$$D \in \mathcal{M} = \left\{ \text{---}\bigcirc\text{---}, \text{---}\bigcirc\text{---}, \text{---}\bigcirc\text{---}, \text{---}\bigcirc\text{---}, \text{---}\bigtriangle\text{---}, \text{---}\bigtriangle\text{---}, \text{---}\bigcirc\text{---} \right\}$$

- We then evaluate each of the master integrals using the **TsiL package**.
[<https://www.niu.edu/smartin/TSIL/>]

Two loop results: Gluon propagator

partial- Conclusions: Yang-Mills sector

- Yang-Mills quantities can be reproduced perturbatively using Curci-Ferrari model.
- Curci-Ferrari model seems to encode the main effects of the complete Landau gauge-fixed Yang-Mills Lagrangian.

partial- Conclusions: Yang-Mills sector

- Yang-Mills quantities can be reproduced perturbately using Curci-Ferrari model.
- Curci-Ferrari model seems to encode the main effects of the complete Landau gauge-fixed Yang-Mills Lagrangian.

➔ However, in the **quark sector** results are not as good as Yang-Mills ones.

The points are lattice data of [Bowman et al, Phys.Rev. D70 (2004)] [M. Peláez, M. Tissier, N. Wschebor, Phys. Rev D90 (2014)].

Quark-Gluon coupling VS Ghost-Gluon coupling

- Quark-gluon coupling constant not too small. $g_q(\mu) = g_g(\mu)\lambda_1(\mu)$

Data from [Skullerud et al. JHEP 0304, 047 (2003)]

Quark-Gluon coupling VS Ghost-Gluon coupling

- As the quark-gluon g_q and YM g_g running coupling constants are different in the infrared, we treat them separately,

- g_g is considered as small parameter. Yang-Mills sector can be studied perturbatively in the infrared.
- g_q is not a small parameter.

- Large N_c limit shows the same general features of QCD.

[G. 't Hooft, *Nucl. Phys. B* **75**, 461 (1974). Witten, *Nucl. Phys. B* **160**, 57 (1979)]

In the large N_c limit, gluon propagators can be replaced by double color lines and

$$\text{gluon propagator} = \text{double color lines} \\ g_q \sim 1/\sqrt{N_c}$$

Organizing the systematic expansion:

- How to implement the systematic expansion, ℓ -order improved expansion:
 - We write all diagrams until ℓ -loops
 - We count the powers of g_g and $1/N_c$
 - We also add higher loop order diagrams with the same powers of g_g and $1/N_c$.

1 Curci-Ferrari model in Landau gauge

2 Preliminary two loop results

3 Quark propagator

4 Conclusions and perspectives

Quark propagator

$$\begin{aligned} (\text{thick arrow})^{-1} &= (\text{thin arrow})^{-1} - \left[\begin{array}{c} \text{gluon loop} \\ \text{ghost loop} \\ \text{quark loop} \\ \text{quark self-energy} \\ \text{gluon self-energy} \\ \text{gluon tadpole} \\ \text{gluon exchange} \\ \text{gluon exchange} \\ \text{gluon exchange} \\ \text{gluon exchange} \end{array} \right] \end{aligned}$$

The diagram shows the Dyson equation for the quark propagator. The left-hand side is the inverse of the full propagator, represented by a thick black arrow. The right-hand side is the inverse of the bare propagator, represented by a thin black arrow, minus a series of diagrams in square brackets. These diagrams represent the sum of all one-particle irreducible (1PI) self-energy corrections to the quark propagator. The corrections include:

- A gluon loop (a loop of wavy lines).
- A ghost loop (a loop of dashed lines).
- A quark loop (a loop of straight lines).
- A quark self-energy correction (a loop of straight lines on the quark line).
- A gluon self-energy correction (a loop of wavy lines on the gluon line).
- A gluon tadpole correction (a loop of wavy lines attached to the quark line).
- A gluon exchange correction (two wavy lines connecting the quark lines).
- A gluon exchange correction (two wavy lines connecting the quark lines).
- A gluon exchange correction (two wavy lines connecting the quark lines).
- A gluon exchange correction (two wavy lines connecting the quark lines).

The diagrams are separated by plus signs, and the entire series is enclosed in large square brackets with an ellipsis (...) indicating that there are more terms in the series.

Quark propagator

$$\begin{aligned} (\text{thick arrow})^{-1} &= (\text{thin arrow})^{-1} - \left[\begin{array}{c} \text{gluon loop} \\ \text{ghost loop} \\ \text{gluon self-energy} \\ \text{gluon tadpole} \\ \text{gluon exchange} \\ \text{gluon exchange} \\ \text{gluon exchange} \\ \text{gluon exchange} \end{array} \right] \end{aligned}$$

The diagram shows the Dyson equation for the quark propagator. The left-hand side is the inverse of the full propagator, represented by a thick black arrow. The right-hand side is the inverse of the bare propagator, represented by a thin black arrow, minus a series of diagrams in square brackets. The diagrams in brackets represent various one-loop corrections to the quark propagator:

- A gluon loop (a semi-circular gluon line with two vertices on the quark line).
- A ghost loop (a semi-circular ghost line with two vertices on the quark line).
- A gluon self-energy diagram (a gluon line with a self-energy loop on it).
- A gluon tadpole diagram (a gluon line with a tadpole loop on it).
- A gluon exchange diagram (two quark lines with a gluon line between them).
- A gluon exchange diagram (two quark lines with a gluon line between them).
- A gluon exchange diagram (two quark lines with a gluon line between them).
- A gluon exchange diagram (two quark lines with a gluon line between them).

Some diagrams are crossed out with a red diagonal line, indicating they are not included in the series. The series ends with an ellipsis (...) inside a large square bracket, indicating that there are higher-order terms.

Quark propagator

$$\begin{aligned} (\longrightarrow)^{-1} &= (\longrightarrow)^{-1} - \left[\begin{array}{c} \text{Diagram 1} \\ \text{Diagram 2} \\ \text{Diagram 3} \\ \text{Diagram 4} \\ \text{Diagram 5} \\ \text{Diagram 6} \\ \text{Diagram 7} \\ \text{Diagram 8} \\ \text{Diagram 9} \end{array} \right] \end{aligned}$$

The diagrams in the brackets represent the following terms:

- Diagram 1: A quark line with a self-energy loop (gluon loop).
- Diagram 2: A quark line with a ghost loop (crossed out with a red slash).
- Diagram 3: A quark line with a ghost loop (crossed out with a red slash).
- Diagram 4: A quark line with a ghost loop (crossed out with a red slash).
- Diagram 5: A quark line with a ghost loop (crossed out with a red slash).
- Diagram 6: A quark line with a ghost loop (crossed out with a red slash).
- Diagram 7: A quark line with a ghost loop (crossed out with a red slash).
- Diagram 8: A quark line with a ghost loop (crossed out with a red slash).
- Diagram 9: A quark line with a ghost loop (crossed out with a red slash).

Rainbow equation

- Only Rainbow diagrams survive

$$\left(\overrightarrow{\text{---}}\right)^{-1} = \left(\overrightarrow{\text{---}}\right)^{-1} \left[\overrightarrow{\text{---}} \text{---} + \right. \\ \left. \overrightarrow{\text{---}} \text{---} \text{---} + \overrightarrow{\text{---}} \text{---} \text{---} \text{---} + \overrightarrow{\text{---}} \text{---} \text{---} \text{---} \text{---} + \dots \right]$$

- They can be resummed in:

$$\left(\overrightarrow{\text{---}}\right)^{-1} = \left(\overrightarrow{\text{---}}\right)^{-1} \overrightarrow{\text{---}} \text{---}$$

which is the well-known **Rainbow approximation** for the quark propagator.

see e.g. [Johnson et al, PRB (1964). Maskawa, PTP (1975). Atkinson et al, PRD (1988). Miransky et al, PRC (2004).]

[Maris et al, IJMP (2003). Roberts et al, EPJST (2007). Eichman et al, PRC (2008).]

Running of the quark-gluon coupling

- Corrections for the quark-gluon vertex:

Running of the quark-gluon coupling

- Corrections for the quark-gluon vertex:

- One-loop-diagram with three-gluon vertex must be included.
- The quark propagator appears always in its full form.
- We define the quark-gluon coupling through

$\lambda'_1 = -\frac{1}{4g_B(d-2)} \text{Im} \sum \text{Tr}(\gamma_\epsilon \Gamma_\mu P_{\mu\nu}^\perp(k) P_{\nu\rho}^\perp(r) P_{\rho\epsilon}^\perp(p))$ in the kinematic configuration corresponding to two equal and orthogonal quark-antiquark momenta (OTE).

$M(p)$, with initial condition $M(10\text{GeV})=0.008, 0.01, 0.015, 0.02$ GeV, $y_{g_g}(10\text{GeV}) = 1,85$
 [M. Peláez, U. Reinosa, J. Serrau, N. Wschebor, in preparation]

- We reproduce spontaneous chiral symmetry breaking.
- Same UV behaviour as in [Aguilar et al, PRD **83** (2011).]

- 1 Curci-Ferrari model in Landau gauge
- 2 Preliminary two loop results
- 3 Quark propagator
- 4 Conclusions and perspectives**

To summarize:

- **pCF** gives very accurate results for two and three-point correlation function in **Yang-Mills sectors**.
- However pCF does not reproduce the hole picture for quarks.
- We propose a **systematic expansion** scheme for QCD at low energy based on a **double expansion** in powers of the coupling strength g_g in the Yang-Mills sector of the theory and in powers of $1/N_c$.

Conclusions

- At leading order, this scheme reproduces the well-known **rainbow approximation**.
- It allows for a systematic study of higher order corrections.
- We are able to implement a **consistent renormalization group** improvement of the rainbow equations that yields a better control of large logarithms.

Conclusions

- At leading order, this scheme reproduces the well-known **rainbow approximation**.
- It allows for a systematic study of higher order corrections.
- We are able to implement a **consistent renormalization group** improvement of the rainbow equations that yields a better control of large logarithms.

Thanks

Rainbow equation

- Rainbow equation represents a system of two coupled integral equations for the two scalar functions of the quark propagator.

$$S(p) = [-iA(p)\not{p} + B(p)]^{-1} = i\tilde{A}(p)\not{p} + \tilde{B}(p),$$

where

$$\tilde{A}(p) = \frac{A(p)}{A^2(p)p^2 + B^2(p)},$$
$$\tilde{B}(p) = \frac{B(p)}{A^2(p)p^2 + B^2(p)},$$

- It is well-known that Rainbow resummation reproduces correctly the phenomenology of **Spontaneous Chiral Symmetry Breaking**.
- Let us stress that the main point here is that the **Rainbow approximation is justified when considering g_g and $1/N_c$ as small parameters**.

- We introduce the renormalization factors: $A_{\mu,\Lambda}^a = \sqrt{Z_A} A_{\mu}^a$, $\psi_{\Lambda} = \sqrt{Z_{\psi}} \psi$, $m_{\Lambda}^2 = Z_{m^2} m^2$, $M_{\Lambda} = Z_M M$ and $g_{q,\Lambda} = Z_{g_q} g_q$.
- Renormalization condition: $S^{-1}(p = \mu_0, \mu_0) = -i\not{p}_0 + M(\mu_0)$
- The renormalized equations take the form:

$$A(p, \mu_0) = Z_{\psi} - Z_{g_q}^2 Z_{\psi}^2 Z_A g_q^2(\mu_0) C_F \int_{|q| < \Lambda} \frac{f(q, p) \tilde{A}(q, \mu_0)}{Z_A [(p+q)^2 + Z_{m^2} m^2(\mu_0)]},$$

$$B(p, \mu_0) = Z_{\psi} Z_M M(\mu_0) + Z_{g_q}^2 Z_{\psi}^2 Z_A g_q^2(\mu_0) C_F \int_{|q| < \Lambda} \frac{(d-1) \tilde{B}(q, \mu_0)}{Z_A [(p+q)^2 + Z_{m^2} m^2(\mu_0)]},$$

$$f(q, p) \equiv \frac{2p^2 q^2 + 3(p^2 + q^2)(p \cdot q) + 4(p \cdot q)^2}{p^2 (q+p)^2}$$

- **At the order g_g^0 and $1/N_c^0$:**
 - No corrections for the gluon propagator: $Z_A \sim 1$ and $Z_{m^2} \sim 1$.
 - No corrections for the quark-gluon vertex: $Z_{g_q} Z_\psi \sqrt{Z_A} \sim 1$
- The equations can be simplified as

$$A(p, \mu_0) = Z_\psi(\mu_0) - g_q^2(\mu_0) C_F \int_q \tilde{A}(q, \mu_0) \frac{f(q, p)}{(p+q)^2 + m^2(\mu_0)},$$
$$B(p, \mu_0) = M(\mu_0) + g_q^2(\mu_0) C_F (d-1) \int_q \tilde{B}(q, \mu_0) \left(\frac{1}{(p+q)^2 + m^2(\mu_0)} - \frac{1}{(\mu_0+q)^2 + m^2(\mu_0)} \right)$$

- **Renormalization Group** equation for the quark propagator:
 $(\mu\partial_\mu - \gamma_\psi + \beta_{X_i}\partial_{X_i})S^{-1} = 0$
- The **solution** at different renormalization scales:

$$S^{-1}(p, \mu, X_i(\mu)) = z_\psi(\mu, \mu_0)S^{-1}(p, \mu_0, X_i(\mu_0)),$$

with $\log z_\psi(\mu, \mu_0) = \int_{\mu_0}^{\mu} \frac{d\mu'}{\mu'} \gamma_\psi(\mu')$

$$\begin{aligned} A(p, \mu_0) &= z_\psi^{-1}(p, \mu_0) \\ B(p, \mu_0) &= z_\psi^{-1}(p, \mu_0)M(p) \\ z_\psi(p, \mu_0) &= Z_\psi(p)/Z_\psi(\mu_0) \end{aligned}$$

- The β -function for g_q takes the form:

$$\beta_{g_q} = \mu \frac{dg_q}{d\mu} \Big|_{g_\Lambda} = g_q \left(\gamma_\psi + \frac{1}{2} \gamma_A \right) + g_q \mu \frac{d\lambda_1^\Lambda(\text{ren})}{d\mu}$$

$$\beta_{g_g} = g_g \left(\gamma_C + \frac{1}{2} \gamma_A \right)$$

- γ_C is computed in its one loop form.
- In order to compute γ_A we include one loop diagrams in gluon propagator, considering full quark propagators in the diagram with a quark loop.
- λ_1 , γ_A and γ_ψ are also coupled with $M(p)$ and $z_\psi(p)$.

Constituent quark mass $M(p = 0)$ as a function of the coupling parameter g_0 for two values of the ultraviolet mass $M(\Lambda_1)$. The variation of g_0 is done by keeping Λ_{QCD} fixed.
