Abstract

We investigated possible existence of ^{7}H resonant state J^π=1/2$^+$, representing it as a five-body system consisting of ^{3}H core and four valence neutrons. To this aim an effective n-^{3}H potential has been constructed in order to reproduce low energy elastic neutron scattering on ^{3}H phase shifts and the ^{5}H resonant ground state in terms of ^{3}H-n-n system. The variational Gaussian Expansion Method was used to solve the 5-body Schrödinger equation, while the resonant state parameters were estimated by means of the stabilization method. We have not found any signature of a narrow low energy resonance in the vicinity of ^{3}H+4n threshold. However we have identified a very broad structure at $E_R \approx 9$ MeV above this threshold, which corresponds to the ^{7}H J^π=1/2$^+$ ground state. In the vicinity of this state, we have also identified a broad structure corresponding to ground state of ^{6}H isotope wirh $J^\pi = 2^-$.

(Received 30 July 2015; revised manuscript received 11 October 2015; published 3 February 2016)

A candidate resonant tetraneutron state is found in the missing-mass spectrum obtained in the double-charge-exchange reaction ^{4}He(^{8}He, ^{8}Be) at 186 MeV/u. The energy of the state is $0.83 \pm 0.65(\text{stat}) \pm 1.25(\text{syst})$ MeV above the threshold of four-neutron decay with a significance level of 4.9σ. Utilizing the large positive Q value of the (^{8}He, ^{8}Be) reaction, an almost recoilless condition of the four-neutron system was achieved so as to obtain a weakly interacting four-neutron system efficiently.

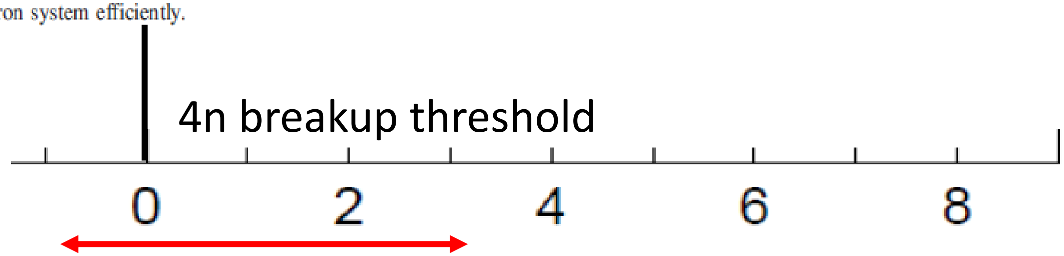
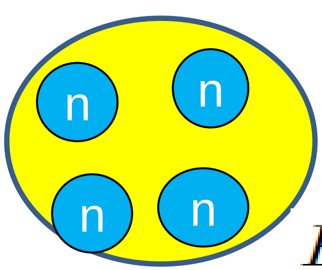
Observation of 4n state by RIBF in 2016
If this observation is reliable,
We observe 'no isotope nucleus'.





～-1.0 MeV Exp. ～3 MeV

$$E_R = 0.83 \pm 0.65 \pm 1.25$$

Γ=2.6 MeV (Upper limit)

Summary of the 4n calculation, currently

Authors	Method	V_{NN}	resonance
A.M. Shirokov et al.	Non-core shell model + phase shift analysis	JISP16	Er=0.8 MeV Γ=1.4 MeV
S. Gandolfi et al.	Quantum Monte Calro extrapolation	chiral(NNLO)	Er～2.1 MeV
K. Fossez et al.,	no-core Gamow shell model	N3LO, JISP16,	Er～7MeV Γ～3.5MeV
E. Hiyama, R. Lazauskas et al.,	Gaussian Expansion + CSM Faddeev Yakubovsky	AV8	No resonance
Deltuva,	Faddeev Yakbobsky + AGS	SRG(AV18),NLO,	No resonance
M. D. Higgins et al.,	Hypersherical harmonics phase shift analysis	AV8, AV18,	no resonance

Theoretically, we come to negative conclusion, no resonant state for 4n.

How do we understand 4n system?

Nuclear physics

Four neutrons might form a transient isolated entity

Lee G. Sobotka & Maria Piarulli

An experiment firing helium-8 nuclei at a proton target has generated evidence that four neutrons can exist transiently without any other matter. But doubts remain, because the existence of such systems is at odds with theory. **See p.678**

656 | Nature | Vol 606 | 23 June 2022

Just recently, experimentally, 4n resonant state has been reported.

Now, is it time to consider this part theoretically?

Volkov NN potential, Hyperspherical harmonics method: 5-body and 7-body calculations
^{5}H: about 1 MeV above t+n+n threshold.
^{7}H: about 3MeV above t+4n threshold
She calculated the energies with bound state approximation.
Then, she did not give decay width for these nuclei.

S. Aoyama and N. Itagaki, PRC80,021304 (R)
Volkov NN potential, AMD calculation
^{7}H: 4.2 MeV above t+4n threshold, no calculation for decay width
No report for the energy of ^{5}H

H. H. Li et al., PRC 104, L061306 (2021)
Gamow shell model calculation using Minnesota NN potential.

Energy and decay width of ^{5}H is 1.4 MeV and 0.5 MeV, respectively.
Energy and decay width of ^{7}H is about 2-3MeV and about 0.1 MeV, respectively.

They predicted to have very narrow decay width for ^{5}H and ^{7}H.

Experiment situation:

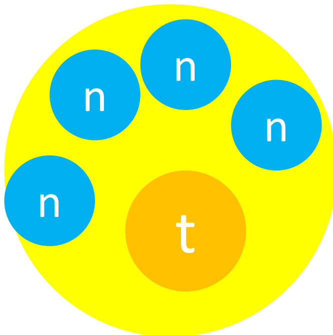
Recently, ^{8}He (p,2p) ^{7}H reaction has been done at RIBF.
RIBF Experimental Proposal NP1512-SAMURAI34.
The analysis is on going.

Then, it is timely to calculate ^{7}H to obtain the energy and width theoretically.

Motivated by this situation, we study ^{7}H structure within the framework of t+4n 5-body problem. We also discuss on the energy and decay width of ^{5}H within t+n+n three-body problem.

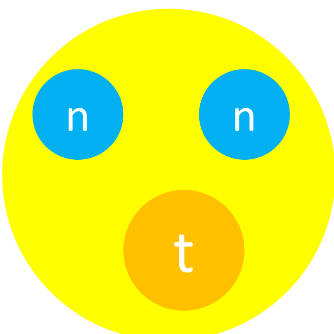
Framework

NN: Minnesota potential (central potential)

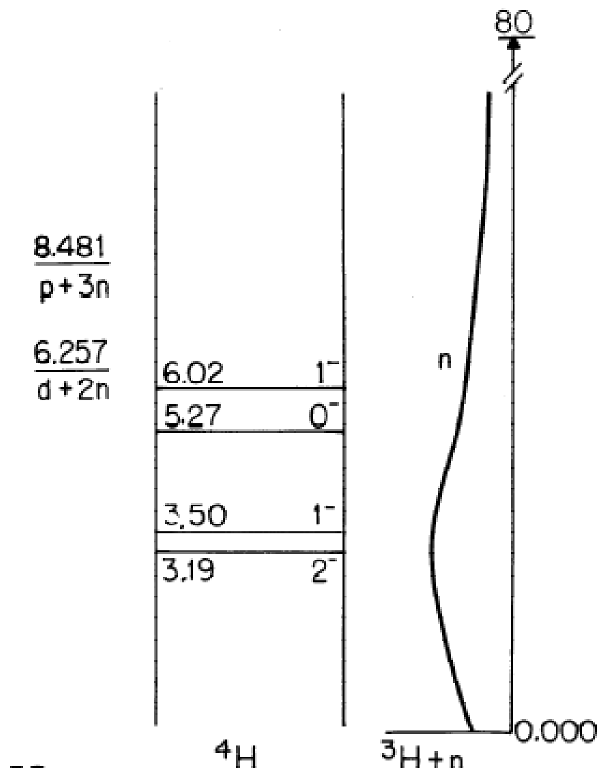


^7H=t+4n model

t-n potential => there is a large degree of ambiguity.
Only several data for phase shift of t-n



^5H



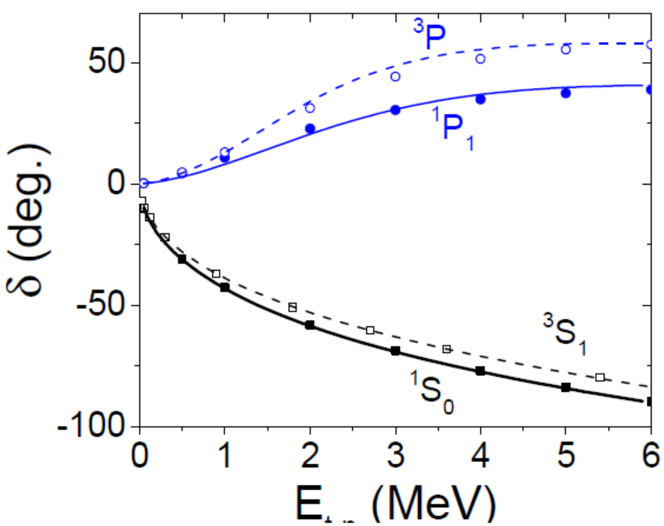
$$V(r,l,s)_{nt} = \delta_{l,0}|\varphi_0\rangle\lambda_\infty\langle\varphi_0| + \sum_{i=1}^{2}\left(v_i^{(c)} + (-)^l v_i^{(P)} + \frac{\hat{s}^2}{2} v_i^{(s)} + (-)^l \frac{\hat{s}^2}{2} v_i^{(SP)}\right)\exp(-\alpha_i r^2)$$

$$|\varphi_0\rangle = \exp(-a_0 r^2)$$

$$\lambda_\infty = \infty$$

i	1	2
$\alpha_i (fm^{-2})$	0.471241	0.0549825
$v_i^{(c)} (MeV)$	−41.3619	1.22768
$v_i^{(P)} (MeV)$	−0.309720	6.89574
$v_i^{(s)} (MeV)$	−28.2483	−0.972465
$v_i^{(SP)} (MeV)$	10.3308	−1.25695

$$a_0 = 0.1979068 \quad fm^{-2}$$



Based on four-body calculation with MT I-III

α_i	V_{nt} (1)	4N [12]
$L = 1^-, S = 0$	1.28-2.61 i	0.88(5)-2.20(5) i
$L = 1^-, S = 1$	1.33-1.84 i	1.08(3)-2.03(3) i

Two-body calculation of t-n is almost consistent with that of 4-body calculation.

+ I introduce a phenomenological three-body t-n-n force to obtain energy trajectory.

$$V_{tnn}(\rho) = -V_0\, e^{-\frac{\rho^2}{b_3^2}} \qquad \rho^2 = \frac{m_n}{M} r_{nn}^2 + \frac{m_t}{M^2} r_{nt}^2 + \frac{m_t}{M^2} r_{nt}^2 \qquad M = 2m_n + m_t$$

^{5}H

Our few-body caluclation method

Gaussian Expansion Method (GEM) , since 1987,

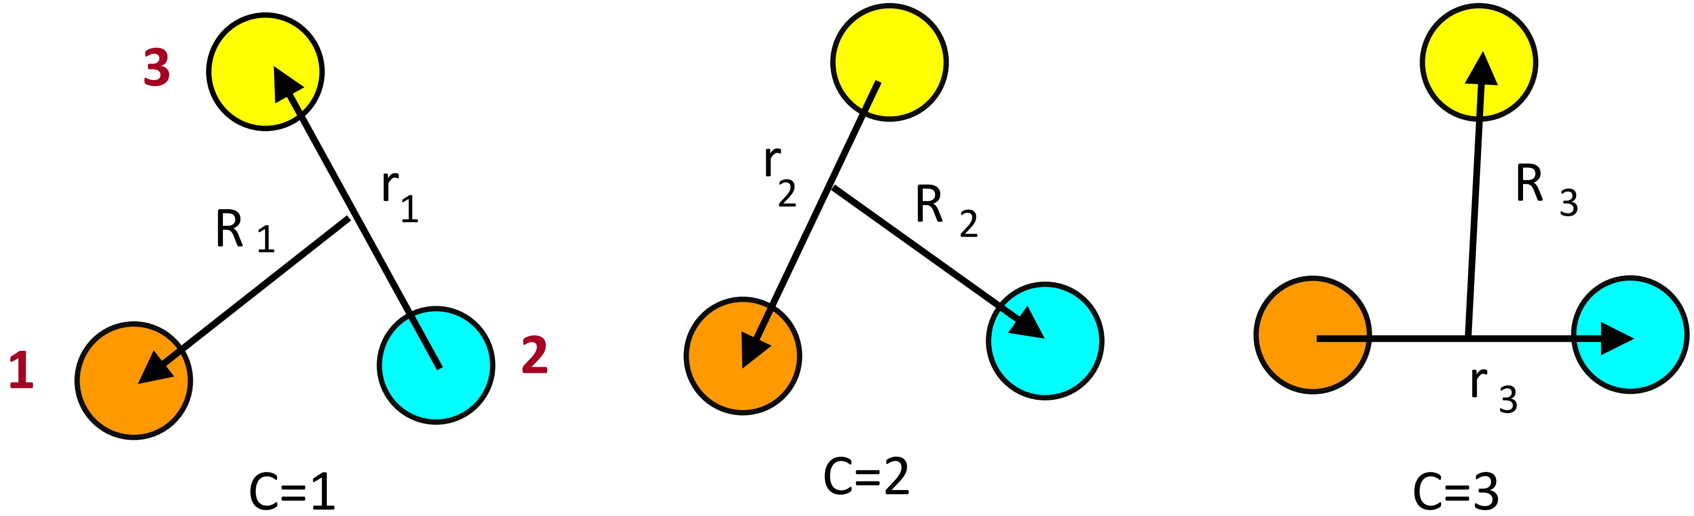
- A variational method using Gaussian basis functions
- Take all the sets of Jacobi coordinates

Developed by Kyushu Univ. Group,
Kamimura and his collaborators.

Review article :
E. Hiyama, M. Kamimura and Y. Kino,
Prog. Part. Nucl. Phys. 51 (2003), 223.

High-precision calculations of various 3- and 4-body systems:

Exotic atoms / molecules ,
3- and 4-nucleon systems,
multi-cluster structure of light nuclei,
Light hypernuclei,
3-quark systems,

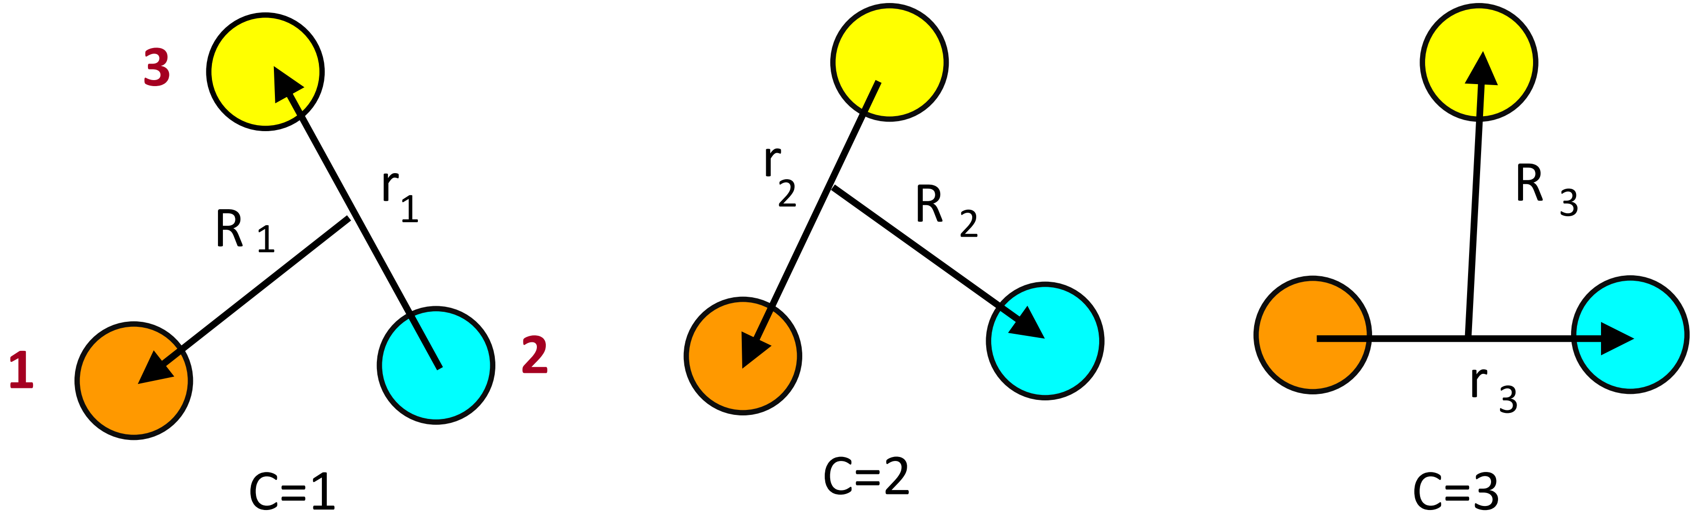


$$(H - E)\Psi_{JM} = 0$$

$$H = T + V_1(r_1) + V_2(r_2) + V_3(r_3)$$

$$T = -\frac{\hbar^2}{2\mu_{r_c}}\nabla^2_{\mathrm{r}_c} - \frac{\hbar^2}{2\mu_{R_c}}\nabla^2_{\mathrm{R}_c} \qquad (c = 1, 2, \text{ or } 3)$$

$$\Psi_{JM} = \Phi^{(1)}_{JM}(\mathrm{r}_1, \mathrm{R}_1) + \Phi^{(2)}_{JM}(\mathrm{r}_2, \mathrm{R}_2) + \Phi^{(3)}_{JM}(\mathrm{r}_3, \mathrm{R}_3)$$



$$\Psi_{JM} = \Phi^{(1)}_{JM}(\mathrm{r}_1, \mathrm{R}_1) + \Phi^{(2)}_{JM}(\mathrm{r}_2, \mathrm{R}_2) + \Phi^{(3)}_{JM}(\mathrm{r}_3, \mathrm{R}_3)$$

Basis functions of each Jacobi coordinate

$$\phi^{(c)}_{nl}(r_c)\, Y_{lm}(\hat{\mathrm{r}}_c), \quad \psi^{(c)}_{NL}(R_c)\, Y_{LM}(\widehat{\mathrm{R}}_c), \quad (c = 1, 2, 3)$$

(θ, ϕ) (Θ, Φ)

$$\Phi^{(c)}_{JM}(\mathrm{r}_c, \mathrm{R}_c) = \sum_{nl,NL} \underline{A^{(c)}_{nl,NL}}\, \phi^{(c)}_{nl}(r_c)\, \psi^{(c)}_{NL}(R_c) \left[Y_l(\hat{\mathrm{r}}_c) \otimes Y_L(\widehat{\mathrm{R}}_c)\right]_{JM}$$

Determined by diagonalizing H

For this purpose, we use the following basis function:

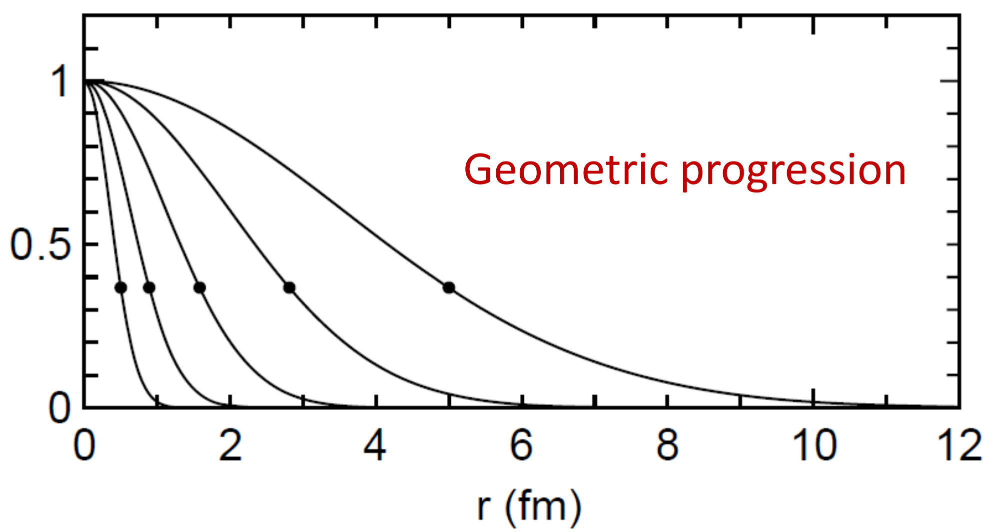
$$\phi_{nlm}(\mathbf{r}) = r^l e^{-\nu_n r^2} Y_{lm}(\widehat{\mathbf{r}})$$

$$\nu_n = \frac{1}{r_n^2}$$

Geometric progression

$$r_n = r_1 a^{n-1} \qquad (n = 1, ..., n_{\max})$$

The Gaussian basis function is suitable not only for the calculation of the matrix elements but also for describing short-range correlations and long-range tail behaviour.



Where the energy and overlap matrix elements are given by

$H_{in} = \langle \Phi_i \mid H \mid \Phi_n \rangle$ (i, n =1,…,N)

$N_{in} = \langle \Phi_i \mid 1 \mid \Phi_n \rangle$ --- non-orthogonal basis

Next, we get eigenenergy E and coefficients C_n
by solving generalized matrix eigenvalue problem,

$$(\mathbf{H} - \mathbf{E})\,\boldsymbol{\Psi} = 0 \qquad \boldsymbol{\Psi} = \sum_{n=1}^{N} \mathbf{C_n}\,\boldsymbol{\Phi}_n$$

↓

$$\left[(H_{in}) - E\,(N_{in}) \right] \left[C_n \right] = 0$$

solution $\Psi = \Psi_0, \Psi_1, \Psi_2, \ldots, \Psi_N$

$E = E_0, E_1, E_2, \ldots, E_N$

The calculation is for the bound states.

$$r_n = r_1 a^{n-1} \qquad (n = 1 - n_{\max})$$

Similarly for the other basis :

$$\psi^{(c)}_{NLM}(\mathbf{R}_c) \qquad \varphi^{(c)}_{n'l'm'}(\boldsymbol{\rho}_c) \qquad \Phi^{(c)}_{N'L'M'}(\mathbf{S}_c)$$

Use of this type gaussian basis is known to be very suitable for describing simultaneously both the short-range correlations and long-range tail behaviour of few-body systems;

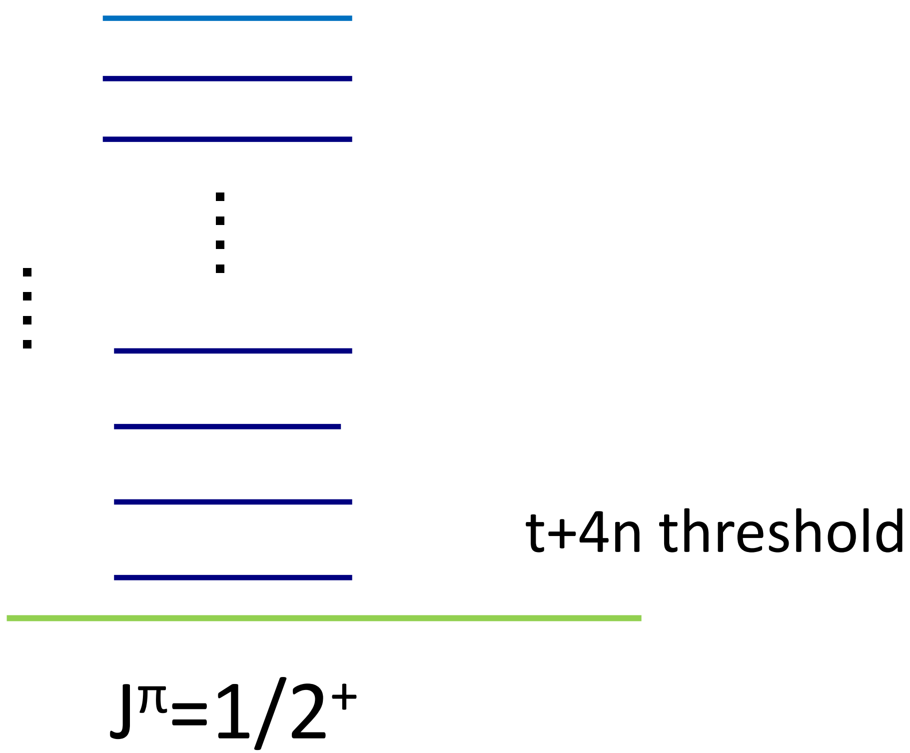
This is precisely shown in →

Gaussian Expansion Method (GEM)
(review paper) E. H., Y. Kino and M. Kamimura, Prog. Part. Nucl. Phys., 51 (2003) 223.

$(H-E)\Psi=0$

By the diagonalization of Hamiltonian, we obtain N eigenstates for each J^{π}.

Here, we use about 56,000 basis functions.
Then, we obtained 56,000 eigenfunctions for $J^{\pi}=1/2^{+}$.



For the calculation of ^7H, it would be difficult to apply complex scaling method for 5-body calculation. Then, for this calculation, I used real scaling method.

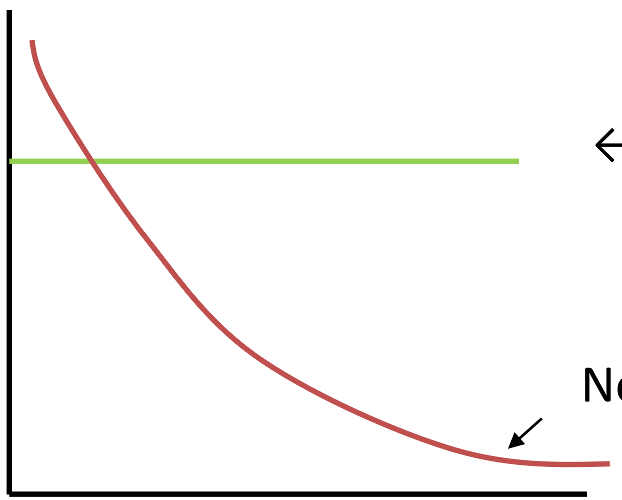
useful method: real scaling method

often used in atomic physics

In this method, we artificially scale the range parameters of our Gaussian basis functions by multiplying a factor α:

$r_n \to \alpha r_n$ in $r^l \exp^{(-r/r_n)^2}$ for exmple $0.8 < \alpha < 1.5$

and repeat the diagonalization of Hamiltonian for many value of α.

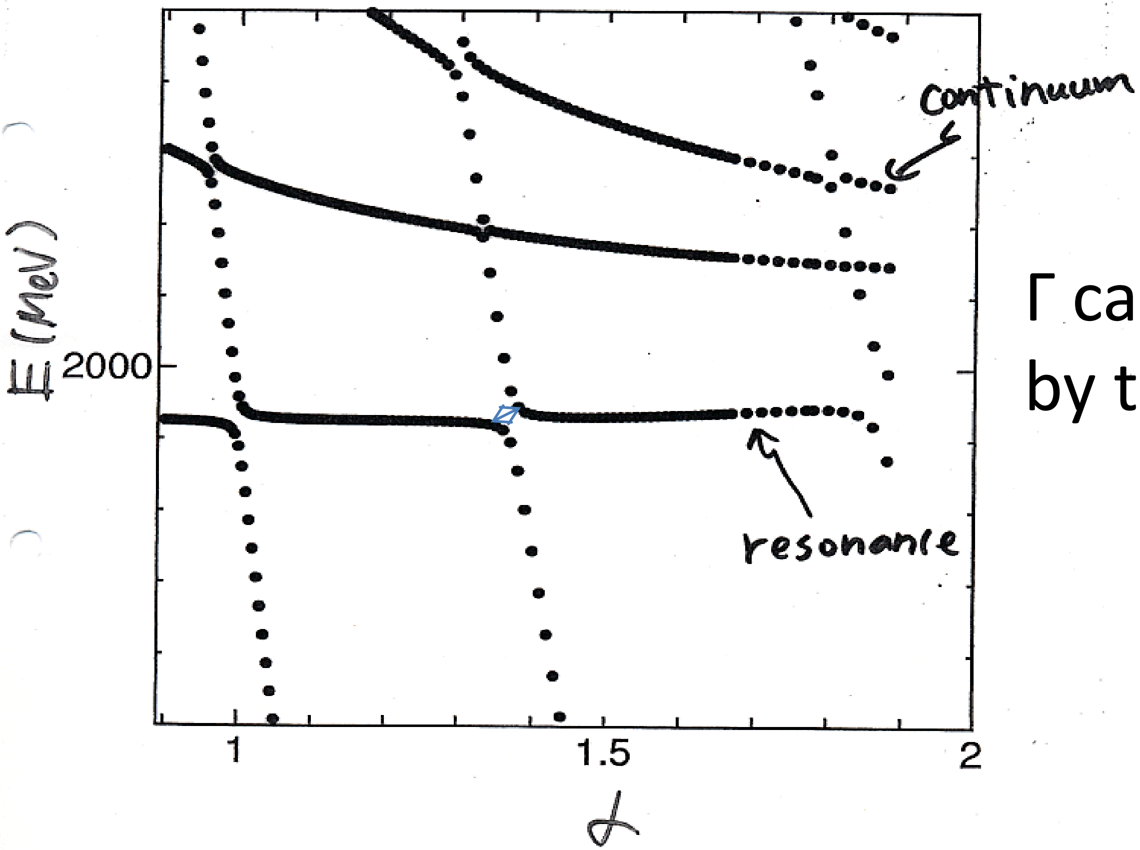


[schematic illustration of the real scaling]

What is the result in our pentaquark calculation?

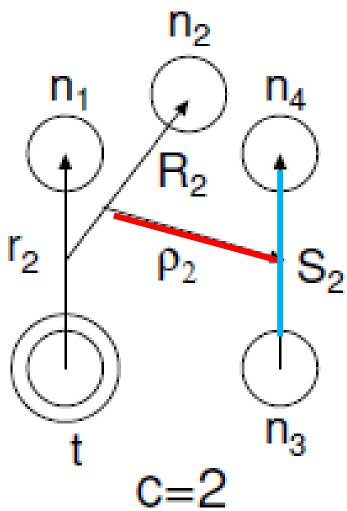
Example of real scaling

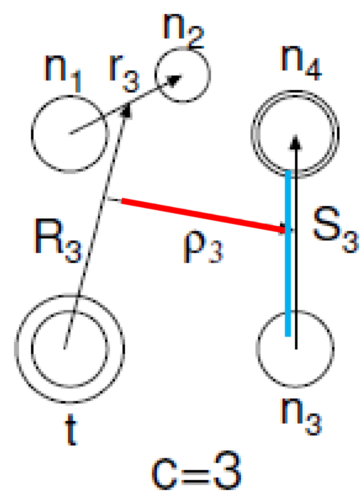
Not result of penta quark system



Γ can be estimated by the ΔE.

What is the result of our pentquark calculation?



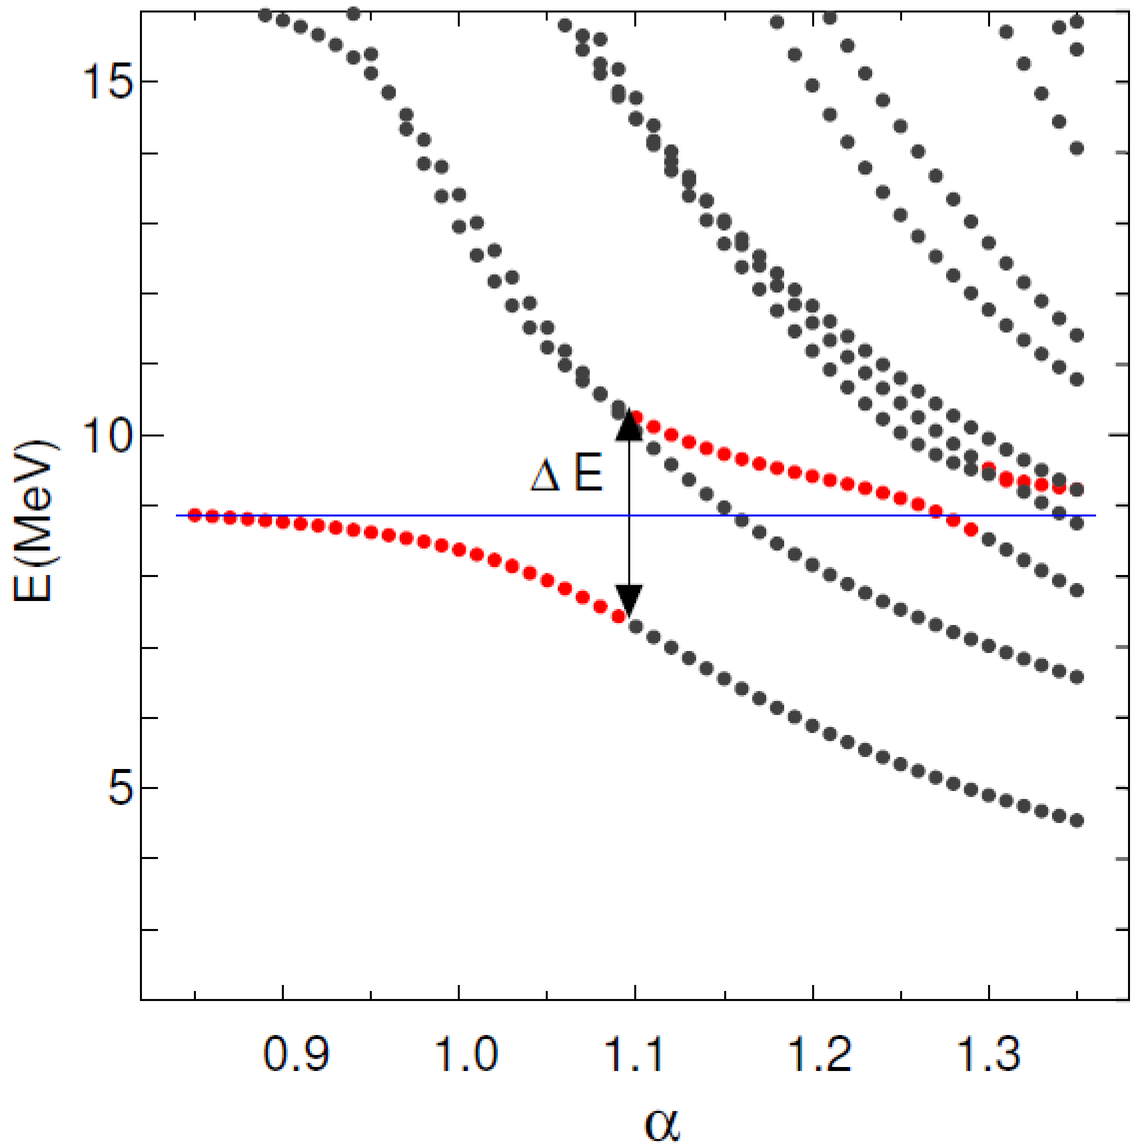


$\rho_n \Rightarrow \alpha\rho_n$

$s_n \Rightarrow \alpha s_n$

$$V_{tnn}(\rho) = -V_0\, e^{-\frac{\rho^2}{b_3^2}}$$

b_3=8.0fm V_0=-3 MeV



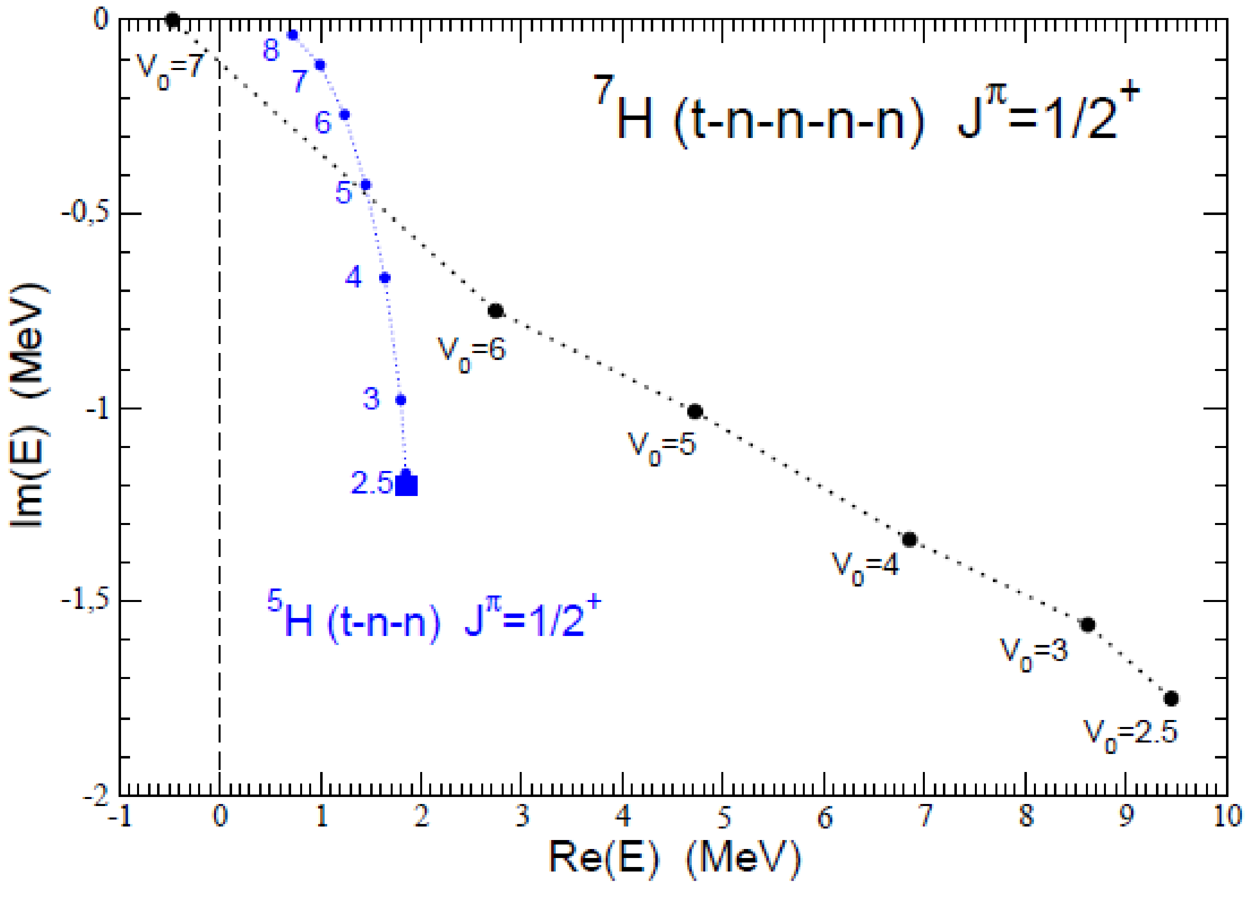
Er～8.8 MeV

Γ～ 3.1 MeV

With respect to t+4n threshold

5H: close to Exp. data

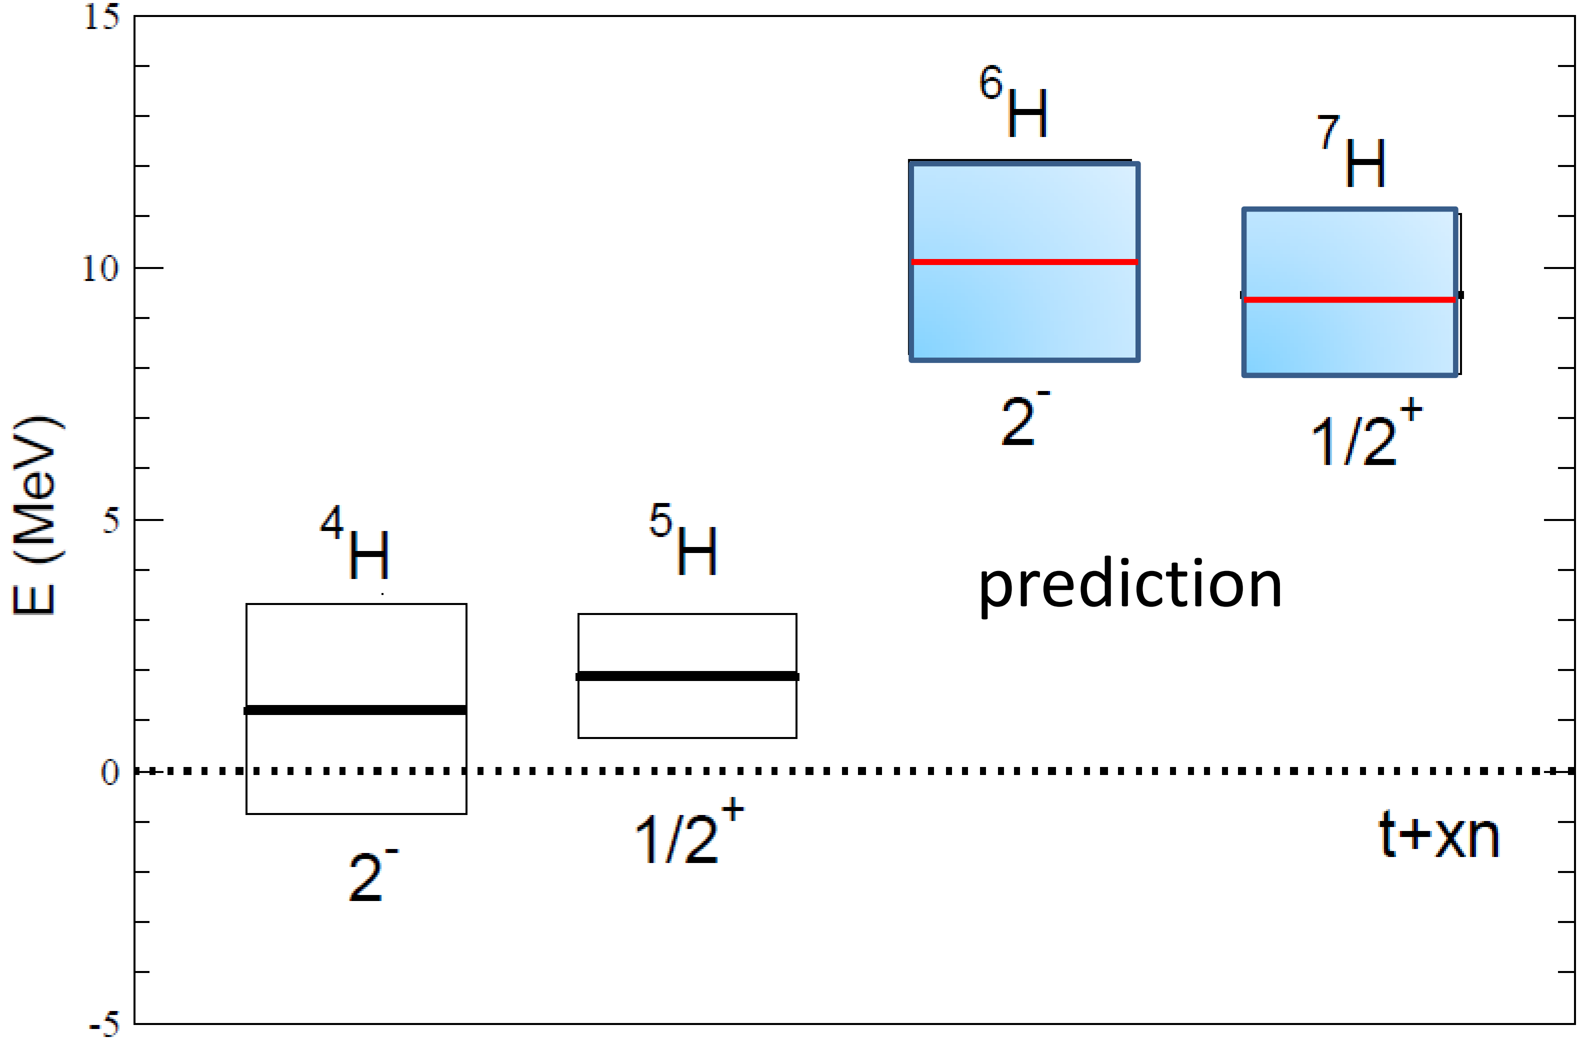
Im (E)=Γ/2



For V_0=2.5, we reproduce the data of ^{5}H accurately.
In this case, the energy pole of ^{7}H, E=9.5 MeV, Γ～3.5 MeV.
Our energy of ^{7}H is much higher and broad decay width.

Summary of H-isotope (according to our calculation)

End of H-isotope



Summary

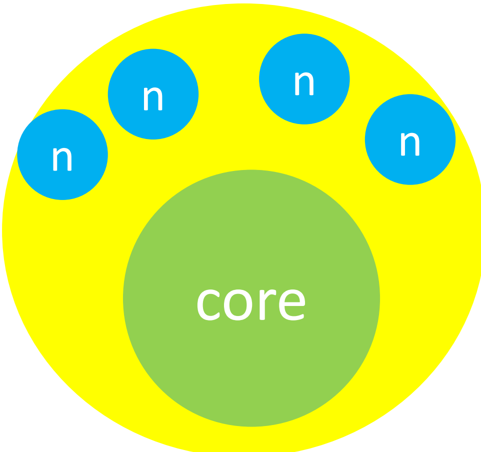
Assuming Er∼1.9 MeV and Γ∼2.4 MeV for ^{5}H,
Our calculated energy and decay width of ^{7}H are
about Er∼ 8 to 9 MeV, and Γ∼ 3 MeV.
That is much higher than ^{5}H+n+n threshold,
broad decay width.

^{8}He (p,2p) ^{7}H reaction was done at RIBF,recently.
RIBF Experimental Proposal NP1512-SAMURAI34.
The analysis is on going. =>The result will be reported by Lenain.

I am waiting for future experimental result.

Thank you!

Future prospect:



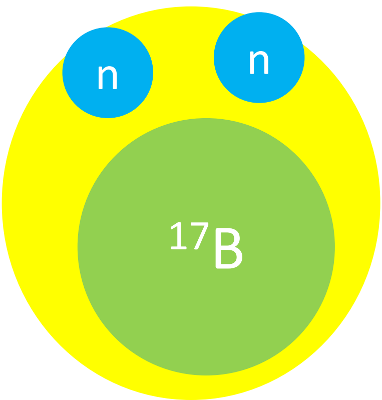
We have a code to calculate core+4n.

We could apply the method to many neutron-rich nuclei.

Example: ^{19}B=^{15}B+4n

Recent measurement of ^{19}B(PRL 124, 212503 (2020)

At that time, E. Hiyama, R. Lazauskas, F.M. Marqu´es, and J. Carbonell,
Phys. Rev. C 100, 011603(R) (2019).



Next, we plan to study ^{17}B+4n.

In order to solve few-body problem accurately,

Gaussian Expansion Method (GEM) , since 1987

- A variational method using Gaussian basis functions
- Take all the sets of Jacobi coordinates

Developed by Kyushu Univ. Group,
Kamimura and his collaborators.
