Top Physics at the LHC and Beyond

Nedaa-Alexandra Asbah Harvard University

ECT* workshop 2022- Trento 31.08.2022

- Top-quark is the **heaviest** of all known fundamental particles $m_{top} \sim 170 \text{ GeV}$
 - a bizarrely steep mass hierarchy
 - Even heavier than the Higgs boson
 - Unique role as a result of its mass
 - Many models predict that the top is special in order to explain its mass

- Leaves us wondering:
 - Is there a hidden connection with the EWSB mechanism?
 - Is the top quark a fundamental particle?

- Strongly interacts with the Higgs sector
 - Large top yukawa coupling yt ~ 1

- Short-lived, it decays before hadronizing
 - $\tau_{had} \approx 2 \times 10^{-24} s$
 - $\tau_{top} \approx 0.5 \times 10^{-24} s$
 - Possible to study the properties of a bare quark
- LHC is a top factory & many top-quarks are produced at the LHC
 - About 25,000 $t\bar{t}$ events are produced every hour
- Gateway to New Physics
 - Precision SM top-quark properties measurements
 - Search for non-SM top-quark interactions
 - Searches of top-quark partners and other states

• We have been doing Top & SM measurements for a long time!

LHC/ HL-LHC Plan (last update February 2022)

Ongoing - More than 10 fb⁻¹ recorded by ATLAS so far!

 Run 1 @ 7 TeV
 Run 1 @ 8 TeV
 Run 2 @ 13 TeV
 Theory

- Rare top production modes become fully accessible with Run 2 data
- $t\bar{t}(t)$ +X events are related to new physics and important backgrounds for rare SM processes

- $t\bar{t}Z/t\bar{t}W$ are among the most massive signatures that can be studied at the LHC with high precision
- Important backgrounds for searches and measurements

• $t\bar{t}$ H was recently observed using 80 fb⁻¹ of Run 2 data-set [ATLAS-CONF-2019-045]

- Even more rare processes
 - $\sigma_{SM}(t\bar{t}t\bar{t}) = 11.97$ fb at NLO QCD + NLO QED at **13 TeV** <u>JHEP 02, 031 (2018)</u>

Top Mass

- Various methods to measure the top quark mass
 - Top quark mass from template fit
 - Likelihood- or MVA-based reconstruction of event (top quark) kinematics
 - Using one- or more-dimensional template functions which are sensitive to top quark mass
 - Fit to data (with top mass as free parameter) to extract best result
 - Dominant systematic uncertainties: jet-related uncertainties (JES/bJES), hadronisation and ISR/FSR MC modelling

ATLAS/CMS results for direct top quark mass measurements (June 2022) ATL-PHYS-PUB-2022-032

Top Mass

• Top quark mass from $t\bar{t}$ +jets cross section:

- Extract top quark mass from inclusive (or differential) cross section measurements
- Best value of top quark pole mass is extracted from χ^2 minimisation between the normalized differential cross section at parton level and theoretical $t\bar{t}$ +jets MC predictions at NLO (using two different input PDF sets)

•
$$m_{top}^{pole} = 172.94 \pm 1.27(fit)_{-0.43}^{+0.51}(scale) \text{ GeV}$$

• $m_{top}^{pole} = 172.16 \pm 1.35(fit)_{-0.40}^{+0.50}(scale) \text{ GeV}$

 Dominant systematic uncertainties arise from scale variations (µR, µF), JES and background normalizations

Top Mass

- Top quark mass using "soft muon tags" (SMT)
 - Measurement of m_{top} with 36 fb⁻¹ data in lepton+jets channel
 - One lepton (electron/muon) from a W boson and a jet containing a "soft" muon (p_T > 8 GeV) originating from a b-hadron decay (SMT-tagged jet)
 - Using a binned likelihood fit on $m_{l\mu}$ (invariant mass between lepton from W and muon from SMT-jet) to extract top quark mass
 - Best fit value of top quark mass: $m_{top} = 174.48 \pm 0.40(stat.) \pm 0.67(syst.) \text{ GeV}$
 - Significantly more precise than previous ATLAS measurements from direct reconstruction of top decay products
 - Dominant systematic uncertainties: branching ratios of b/c-hadron decays to muons, pile-up modeling and b-fragmentation function

Observation of $tq\gamma$

ATLAS-CONF-2022-013

• Strategy:

- Events contain one isolated photon, one isolated lepton (e/μ) , one b-tagged jet, and jet in the forward direction
- Two signal regions are defined with 0 and \geq 1 forward jet
- Dedicated control regions are defined for the main backgrounds coming from $t\bar{t}\gamma$ and $W\gamma$ + jets
- Fake photons ($e \rightarrow \gamma, j \rightarrow \gamma$) are estimated using data-driven method
- Signal and backgrounds are separated using a Neural Network
- Results:
 - The observed (expected) significance is 9.1σ (6.7 σ)
 - Fiducial measurements:
 - parton-level cross section: $580 \pm 19(stat.) \pm 63(syst.)$
 - particle-level cross section: $287 \pm 8(stat.) \pm 31(syst.)$
 - Systematics dominated by modeling of $t\bar{t}\gamma$ and the limited number of MC event for background processes and the $tq\gamma$ signal

Neural network output

NO RU LES ELARVADO

Observation of the electroweak production of tZq

• Strategy:

- Events contain three isolated leptons (e/μ)
 - One pair should build a Z mass peak
- Two or three jets, one of which is identified as containing a b-hadron (b-tagged)
- Large background coming from diboson+Heavy Flavour jets (VV+HF)
- Signal and backgrounds are separated using a Neural Network
- Signal fraction is estimated using a profile-likelihood fit
- Results:
- Yields a tZq production cross section of
 97 ± 13 (stat.) ± 7 (syst.) fb [SM cross section: 102⁺⁵₋₂ fb]
- Statistically limited, systematics dominated by prompt lepton background
- Observation with $> 5\sigma$

<u>JHEP 07 (2020)</u>

Neural network output

ttW

- W mainly couples to initial state quarks
 - Significant charge asymmetry
- t-W scattering sensitive to top quark coupling to neutral bosons
- Previous ATLAS and CMS measurements with 36 fb⁻¹ data
 - higher cross section than prediction

- Using 138 fb⁻¹ of run 2 data
- Using events with 2 SS or 3 e/µ
- Inclusive measurement compared to 2 predictions: NLO+NNLL [<u>A. Kulesza et al.</u>]; NLO+2j@LO with improved FxFx ME merging [<u>R. Frederix, I. Tsinikos</u>]

Production of four tops

- Rare process predicted by the SM and has never been observed
 - $\sigma_{SM}(t\bar{t}t\bar{t}) = 11.97$ fb at NLO (QCD+QED) at **13 TeV**
- Sensitive to the magnitude and CP properties of the Yukawa coupling of the top quark to the Higgs boson
- Sensitive to many BSM models (EFT, 2HDM SUSY, ...)
- Channels are split according to:
 - 2**¿SS** (7%) / 3**¿** (5%)
 - Small branching fraction & Small background $(t\bar{t}W, t\bar{t}Z, non-prompt leptons, charge misidentification)$
 - Most sensitive channel
 - 12 (42%) / 220S (14%)
 - Dominant branching fraction
 - Large irreducible background from tt+jets (tt+heavy flavour jets)

Production of four tops

- Targeting events with high jet and b-jet multiplicities
- Split in multiple regions: Control (CR) signal (SR) and ≥5b validation (VR) regions 4b
 - Dedicated Control Regions are defined to constrain normalisation factors in 28S/38 channel
 - Designed a 3-step sequential re-weighting to target different type of mismodeling in the 1**l**/2**l**OS

Regions in the 1I channel

H^{all} [GeV]

Production of four tops

- Signal is separated from background based on a BDT in the SR
- A simultaneous profile likelihood fit is performed in the CR and SR

1L/2LOS

2LSS/3L

Combined

0

- The combined four-top cross-section: $\sigma(t\bar{t}t\bar{t}) = 25^{+7}_{-6} fb$
- To be compared to $\sigma(t\bar{t}t\bar{t}) = 12 \pm 2.4 \, fb$
- Compatible with the SM prediction within 2.0 σ
- Observed (expected) significance: 4.7 (2.6) σ
- The dominant systematics uncertainties:
 - modeling of the four top signal
 - modeling of $t\bar{t}W$ and $t\bar{t}$ +jets
 - b-tagging and Jet Energy Scale

Best-fit $\mu = \sigma_{\text{tftf}} / \sigma_{\text{tftf}}^{\text{SM}}$

22

Searches for Flavour Changing Neutral Current (FCNC)

- FCNC in the SM is forbidden at treelevel: heavily suppressed in loops by GIM mechanism BRs ~10⁻¹⁴
- BSM can enhance FCNC up to ~10⁻⁴
 - Many potential models: 2HDM, MSSM, RPV SUSY, …
- Any observation of FCNC can hint to new physics
- FCNC probe can be done in both top quark production, and decay

Summary of the current 95% confidence level observed limits on the branching ratios of the top quark decays via FCNC

ATL-PHYS-PUB-2022-030

FCNC Search for top-gluon with $t \rightarrow l\nu b$

2112.01302

- Target l + b-tagged jet and E_T^{miss}
- Main backgrounds: $W + b\bar{b}$, t-channel single-top and $t\bar{t}$ production
 - Multijet contribution determined in a data-driven way by fitting E_T^{miss} and $m_T(W)$
- Neural Network (NN) used to construct two discriminants:

- D1 targeting top antiquark production $\bar{u}/\bar{c} + g \rightarrow \bar{t}$: signal region for tcg and tug in l^- channel
- D2 aimed at direct top quark production $u + g \rightarrow t$: signal region for tug in l^+ channel

FCNC Search for top-photon

- Searching for the production and decay mode of FCNCs with a top and a photon
 - Four couplings: $tc\gamma$, $tu\gamma$ (left- and right-handed)
- Events require one high-momentum photon and a semileptonically decaying top quark
- Main backgrounds arise from prompt photons and misidentified photons
 - Estimated using dedicated CRs and data-driven method

Expected background composition of the SR, CR $W\gamma$ + jets, CR $t\bar{t}\gamma$

accepted by Phys. Lett. B

FCNC Search for top-photon

accepted by Phys. Lett. B

- Two neural networks are trained for $tu\gamma$ and $tc\gamma$
- Observed (expected) upper limits of BR
 - Factor 5 (tuγ LH), 5 (tuγ RH), 9 (tcγ LH), 8 (tcγ RH) improvements in expected limits on B(t → qγ)
 - Factor 3 (tuγ LH), 5 (tuγ RH), 5 (tcγ LH), 4 (tcγ RH) smaller observed upper limits on B(t → qγ)

95% CL limits on the effective coupling constants and BRs

Effective coupling	Coefficient limits		Coupling	BR limits [10 ⁻⁵]

Results with Run 2

- Run 2 opened up measurements to new rare SM processes
- We've found exciting results using the full run 2 data-set
 - Observation of many rare processes with top quarks
 - A slight excess in the measured
 tītī cross section, but still
 compatible with the SM prediction
 within 2 σ

What's next for Top physics

- Why keep doing Top & SM measurements?
 - Teach us about the SM
 - Improves our theoretical calculations, MC modelling, and understanding of CP calibrations and uncertainties
 - Measurements will be important for constraining PDFs, understanding electroweak symmetry breaking (EWSB), and measuring fundamental properties of the SM
 - Can uncover unexpected deviations from the SM
- The HL-LHC will provide the opportunity for more precision, particularly at high energies which are currently limited by statistical uncertainties

lop mass

 Current uncertainties are ~600 MeV, projected to be reduced to 200 MeV. at the HL-LHC

30

Top quark mass measurement using $t\bar{t}$ pairs with a J/ψ

- Measurements using $t\bar{t}$ pairs with a $J/\psi \rightarrow \mu\mu$ in final state using the strong correlation between m_{top} and $m(lJ/\psi)$
 - BR ($b \rightarrow J/\psi(\rightarrow \mu\mu) + X$) ~10⁻³

- Will benefit from larger data samples from the HL-LHC
- A reduction of $t\bar{t}$ modeling uncertainties by a factor of two and a reduction of some of the experimental uncertainties by up to a factor two are assumed for these projections
 - Main result of this study is a statistical projection of the measurement
- ATLAS [ATL-PHYS-PUB-2018-042]: a statistical uncertainty of ~0.14 GeV is expected with a systematic uncertainty of 0.48 GeV
 - Dominant uncertainties are from signal modeling (fragmentation functions / b-hadron fractions) and from JES/JER
- CMS [<u>CMS-PAS-FTR-16-006</u>]: expected to yield an ultimate relative precision below 0.1% at the HL-LHC

m_{top} measurements will be an important element of HL-LHC

FCNC

- Search prospects for gluon-mediated FCNC in top quark production via tug and tcg vertices were studied with CMS HL-LHC detector
- Dominant uncertainty is normalization of multi-jet background
- Limits on branching fractions:
 - $B(t \rightarrow ug) < 3.8 \times 10^{-6}$
 - $B(t \rightarrow cg) < 32 \times 10^{-6}$

Exploiting full HL-LHC dataset will allow us to improve current limits by an order of magnitude

See back-up for more examples

Extrapolation Studies for *ttttt*

- The expected cross-section of tttt at 14 TeV is 15.83 +18%/ -21% fb (JHEP 02 (2018) 031)
 - An increase by a factor of 1.3 with respect to 13 TeV
- Extrapolation studies are performed with the setup that uses HT as fitted variations in five signal regions
 - Easier to extrapolate than the result using the BDT score
 - Almost the same significances as with the BDT

Channel	Selection criteria
Common	$N_j \ge 6$, $N_b \ge 2$ and $H_T > 500$ GeV
SR2b2l	SS events with $N_b = 2$
SR2b31	multilepton events with $N_b = 2$
SR3b21	SS events with $N_b = 3$
SR3b31	multilepton events with $N_b = 3$
SR4b	events with $N_b \ge 4$

- "Run 2" : systematic uncertainties are kept equal to their Run 2 values except uncertainties related to $t\bar{t}W + 7/8$ jets (take the post-fit values of the corresponding nuisance parameters from the 139 fb⁻¹ result)
- "Run 2 Improved": includes the $t\bar{t}W + 7/8$ jets scaling and includes a decrease of the systematic uncertainties explained in the previous slide

Expected Sensitivity

- A significance of 6.4σ for the SM $t\bar{t}t\bar{t}$ process is expected in the "Run 2 Improved" scenario
 - Expecting total uncertainty on the cross section of ~14%
 - Experimental precision is expected to be significantly better than the precision of the current SM computation
- The better sensitivity is driven by:
 - Smaller theoretical uncertainties assumed in the $t\bar{t}t$ cross section
 - Better modeling of the $t\overline{t}W/t\overline{t}Z$ + HF jets
 - Smaller b-tagging experimental uncertainties

Expected significance

Expected experimental uncertainty

Sensitivity Studies by CMS

- Based on the run-2 results with 36 fb⁻¹
- Tried various treatment of systematic uncertainties

Source uncert.	Stat. only	Run 2	YR18	YR18+
Statistical	$(L/L_{ref})^{-0.5}$	$(L/L_{ref})^{-0.5}$	$(L/L_{ref})^{-0.5}$	$(L/L_{ref})^{-0.5}$
Experimental	None	Original	$\max(0.5, (L/L_{ref})^{-0.5})$	$(L/L_{ref})^{-0.5}$
Int. Luminosity	None	Original	0.4	0.4

Bckgrnd cross section	None	Original	0.5	0.5
Signal cross section	None	Original	0.5	0.5

Expected significance of $t\bar{t}t\bar{t}$ signal over a background-only hypothesis

Int. Luminosity	Stat. only	Run 2	YR18	YR18+
$300 {\rm fb}^{-1}$	4.09	2.71	2.85	2.93
$3 ab^{-1}$	12.9	3.22	4.26	4.49

Sensitivity Studies by CMS

- A 4.5σ significance is expected with the most optimistic systematics scenario
- Cross-section can be constrained down to 9% statistical uncertainty and 18% to 28% total uncertainty (depending on the considered systematic uncertainties)

Conclusions

- HL-LHC will offer a great opportunity for many top measurements & top related searches
- Detector upgrades will allow for better forward jet and lepton reconstruction
 essential to improve current measurements
- Will produce currently unachievable measurements
- Improve our understanding and learn more about the SM
- Can uncover unexpected deviations from the SM pointing to new physics
- Improving theoretical uncertainties is a key player to achieve better precision

Table 1. Overview of the requirements applied when selecting events in the signal and control regions. OSSF is an opposite-sign same-flavour lepton pair. OSDF is an opposite-sign different-flavour lepton pair.

Variable	Ra	ank	Definition
	$\mathrm{SR}\ 2\mathrm{j}1\mathrm{b}$	SR 3j1b	
$m_{b \mathrm{j}_\mathrm{f}}$	1	1	(Largest) invariant mass of the b -jet and the untagged jet(s)
$m_{ m top}$	2	2	Reconstructed top-quark mass
$ \eta(\mathrm{j_f}) $	3	3	Absolute value of the η of the $j_{\rm f}$ jet
$m_{ m T}(\ell, E_{ m T}^{ m miss})$	4	4	Transverse mass of the W boson
b-tagging score	5	11	b-tagging score of the b -jet
$H_{ m T}$	6	_	Scalar sum of the $p_{\rm T}$ of the leptons and jets in the event
$q(\ell_W)$	7	8	Electric charge of the lepton from the W -boson decay
$\left \eta(\ell_W)\right $	8	12	Absolute value of the η of the lepton from the $W\text{-}\mathrm{boson}$ decay
$p_{\mathrm{T}}(W)$	9	15	$p_{\rm T}$ of the reconstructed W boson
$p_{\mathrm{T}}(\ell_W)$	10	14	$p_{\rm T}$ of the lepton from the $W\text{-}{\rm boson}$ decay
$m(\ell\ell)$	11	_	Mass of the reconstructed Z boson
$ \eta(Z) $	12	13	Absolute value of the η of the reconstructed Z boson
$\Delta R(\mathrm{j_f},Z)$	13	7	ΔR between the \mathbf{j}_{f} jet and the reconstructed Z boson
$E_{\mathrm{T}}^{\mathrm{miss}}$	14	_	Missing transverse momentum
$p_{ m T}(m j_f)$	15	10	$p_{\rm T}$ of the ${\rm j_f}$ jet
$ \eta(\mathbf{j_r}) $	_	5	Absolute value of the η of the j_r jet
$p_{ m T}(Z)$	_	6	$p_{\rm T}$ of the reconstructed Z boson
$p_{\mathrm{T}}(\mathrm{j_r})$	_	9	$p_{\rm T}$ of the ${\rm j_r}$ jet

Table 2. Variables used as input to the neural network in SR 2j1b and SR 3j1b. The ranking of the variables in each of the SRs is given in the 2^{nd} and 3^{rd} columns, respectively. The untagged jet is denoted j_f . When two untagged jets are selected, $j_f(j_r)$ refers to the one for which the invariant mass of this untagged jet and the *b*-tagged jet is the largest (smallest). The *b*-tagging score indicates whether the *b*-jet would also satisfy a tighter *b*-tagging requirement corresponding to a working point with an efficiency of 60% instead of 70%.

Uncertainty source	$\Delta\sigma/\sigma$ [%]

$t\overline{t} + tW$ and $Z + jets$ normalisation	2.1
Total statistical uncertainty	12.9

Table 4. Impact of systematic uncertainties on the tZq cross-section, broken down into major categories. For each category the impact is calculated by performing a fit where the nuisance parameters in the group are fixed to their best-fit values, and then subtracting the resulting uncertainty in the parameter of interest in quadrature from the uncertainty from the nominal fit. For simplicity, the impact is given as the average of the up and down variations. Details of the systematic uncertainties are provided in the text. MC statistics refers to the effect of the limited size of the MC samples. The total systematic uncertainty is a bit larger than the quadratic sum of the individual contributions due to correlations.

Table 1 The definitions of the trilepton signal regions: for the inclusive measurement, a combination of the regions with pseudo-continuous *b*-tagging 3ℓ -Z-1*b*4*j*-PCBT and 3ℓ -Z-2*b*3*j*-PCBT is used, whereas for

the differential measurement only the region 3ℓ -Z-2b3j with a fixed b-tagging WP is employed

Table 8 Summary of the variables used for the differential measurements. Some variables are considered for the trilepton or tetralepton signal regions only, as indicated. The jet multiplicity is measured for

the two topologies separately, whereas for the variables related only to the kinematics of the Z boson $(p_T^Z \text{ and } |y^Z|)$, the trilepton and tetralepton regions are combined

Variable	Definition
$3\ell + 4\ell$	
p_{T}^{Z}	Transverse momentum of the Z boson
$ y^{Z} $	Absolute value of the rapidity of the Z boson
3ℓ	
Njets	Number of selected jets with $p_T > 25 \text{ GeV}$ and $ \eta < 2.5$
$p_{\mathrm{T}}^{\ell,\mathrm{non-}Z}$	Transverse momentum of the lepton which is not associated with the Z boson
$ \Delta \phi(Z, t_{\text{lep}}) $	Azimuthal separation between the Z boson and the top quark (antiquark) featuring the $W \rightarrow \ell \nu$ decay
$ \Delta y(Z, t_{\text{lep}}) $	Absolute rapidity difference between the Z boson and the top quark (antiquark) featuring the $W \rightarrow \ell \nu$ decay
4ℓ	
N _{jets}	Number of selected jets with $p_{\rm T} > 25 \text{GeV}$ and $ \eta < 2.5$
$ \Delta \phi(\ell_t^+,\ell_{\overline{t}}^-) $	Azimuthal separation between the two leptons from the $t\bar{t}$ system
$ \Delta \phi(t\bar{t},Z) $	Azimuthal separation between the Z boson and the $t\bar{t}$ system
$p_{\mathrm{T}}^{tar{t}}$	Transverse momentum of the $t\bar{t}$ system

FCNC Search for $t \rightarrow Zq$

ATLAS-CONF-2021-049

• Strategy:

- Events contain three isolated leptons leptons (e, μ) \geq 2 jets, (one b-tagged) and MET
- Only Z boson decays into charged leptons and leptonic W boson decays are considered as signal
- 2 signal regions (SRs) considered targeting FCNC in production and decay:
 - SR1 (ttbar decay): ≥2 jets, 1 b-tag
 - SR2 (tZ production): 1& 2 jets, 1 b-tag
- Events reconstructed via minimisation of kinematic properties of the final state objects under the FCNC top hypothesis
 - Mass veto to ensure orthogonality in 2j events
- Largest background contributions from Diboson and $t\bar{t}Z$

Mass of the FCNC top-quark candidate in SR1

59

FCNC Search for $t \rightarrow Zq$

- Gradient BDT used to better separate signal from backgrounds
- Four separate fits performed to extract LH and RH results for the FCNC tZu and tZc couplings
- Good agreement between MC predictions and data
- 95% CL upper limits set on branching ratios for both tZu and tZc vertices and for both RH/LH couplings
 - Improved by a factor of 2-3 on previous limits
- Limits on relevant EFT Wilson coefficients for vertices also set

Observable	Vertex	Coupling	Observed	Expected
$\mathcal{B}(t \to Zq) [10^{-5}]$	tZu	LH	6.2	$4.9^{+2.1}_{-1.4}$
$\mathcal{B}(t \to Zq) [10^{-5}]$	tZu	RH	6.6	$5.1^{+2.1}_{-1.4}$
$\mathcal{B}(t \to Zq) [10^{-5}]$	tZc	LH	13	11^{+5}_{-3}
$\mathcal{B}(t\to Zq)[10^{-5}]$	tZc	RH	12	10_{-3}^{+4}
$ C_{uW}^{(13)*} , C_{uB}^{(13)*} $	tZu	LH	0.15	$0.13^{+0.03}_{-0.02}$

Inclusive & differential $t\bar{t}Z$ production Eur. Phys. J. C 81 (2021) 737

- 10 observables unfolded to parton and particle level
 - Sensitive to BSM effects and modeling
- Dominated by stat. uncertainty
- Main systematic uncertainties are: Fake leptons, WZ modeling, $t\bar{t}Z$ modeling, and b-tagging

Good agreement with the prediction!

ttW CMS Results

- Precision obtained in the present study is significantly improved with respect to the previous measurement with partial run 2 data-set
- Improvements come from a larger data sample, an improved analysis strategy and improved estimates of dominant background contributions using control regions in data
- Inclusive measurement compared to 2 predictions: NLO+NNLL [<u>A. Kulesza et</u> <u>al.</u>]; NLO+2j@LO with improved FxFx ME merging [<u>R. Frederix, I. Tsinikos</u>]

ttW CMS Results

- Luminosity: overall uncertainty of 1.6%
- Pileup: varying the assumed minimum-bias cross section of 69.2 mb by ±4.6%
- Trigger efficiency: ~2% treated as uncorrelated among data-taking years, as well as between the dileptonic and trileptonic channels
- Lepton efficiency: at most a few percent and assumed to be uncorrelated among lepton flavors and datataking years
- JES/JER: 21 uncertainty sources corresponding to different detector regions and taking into account the year-to-year correlations
- b-tagging: considered as fully correlated between b and c quark jets, and uncorrelated for other quark flavors
- Non-prompt leptons: overall normalization, uncertainties due to the dependence on the lepton p_T and η, and 20% to cover remaining mismodeling in the validation region

Differential $t\bar{t}$ cross-section measurements

- Done in e/μ +jets channels
- Most significant reduction of uncertainty is expected to come from:
 - Improved jet energy calibration
 - Reduced uncertainty in the b-jet identification
- Final projected uncertainty is estimated below 5%
- Precision in the measurement will profit from the enormous amount of data and the extended ηcoverage of the Phase-2 CMS detector, which enables fine-binned measurements at high rapidity that are not possible with the current detector
- Uncertainties of the gluon distribution are drastically reduced and depend directly on the uncertainty of the integrated luminosity (assumed to be 1%)

Prospects at HL-LHC of the relative gluon uncertainties of the original and profiled NNPDF3.1 PDF set

ttZ and EW top couplings at the HL-LHC

• Expected sensitivity to Wilson coefficients of top quark operators C_{tZ} in the ttZ process

FCNC - tZq

- Done in the three charged lepton final states
- The dominant sources of uncertainties, in both signal and background estimations, are from the theoretical normalization and the modeling of the background processes MC
- An improvement by a factor of four is expected over the current Run-2 analysis

	-1 σ	Expected	+1 σ
$\mathcal{B}(t \to uZ)$	4.9×10^{-5}	6.9×10^{-5}	9.7×10^{-5}
$\mathcal{B}(t \to cZ)$	5.8×10^{-5}	8.1×10^{-5}	12×10^{-5}

Table 6: The expected 95% confidence level upper limits on the top-quark FCNC decay branching ratios are shown together with the $\pm 1\sigma$ bands, which include the contribution from the statistical and systematic uncertainties. Presented limits are extracted from "Asimov data" in the signal and background control regions, defined as the total expected pre-fit background. Systematic uncertainty from the MC statistical uncertainty is considered as well.

Operator	Expected limit
$ C_{uB}^{(31)} $	0.13
$ C_{uW}^{(31)} $	0.13
$ C_{uB}^{(32)} $	0.14
$ C_{uW}^{(32)} $	0.14

Table 8: Expected 95% CL upper limits on the moduli of the operators contributing to the FCNC decays $t \rightarrow uZ$ and $t \rightarrow cZ$ within the TopFCNC model for a new-physics energy scale $\Lambda = 1$ TeV.

Extrapolation scenarios for 4tops

- Looked into several extrapolation scenarios based on how to scale the systematics with the assumption agreed for the 2019 Yellow Report
- Followed the recommendations explained in the High Lumi LHC Systematics
 - Modelling uncertainties could be halved (<u>ATL-PHYS-PUB-2019-005</u>)
 - No dedicated studies for HL-LHC expected performance, except for HF
 - Recommended way to apply flavor tagging uncertainties is to scale down the nuisance parameters from the current analyses
 - Systematics driven by intrinsic detector limitations are left unchanged, or revised according to detailed simulation studies of the upgraded detector

Sensitivity of the SM $t\bar{t}t\bar{t}$ cross section at the HL-LHC

- The cross-section can be constrained down to 9% statistical uncertainty and 18% to 28% total uncertainty, depending on the considered systematic uncertainties, while a 4.5σ significance is expected with the most optimistic systematics scenario
- The expected sensitivity on the tttt cross-section is also used to provide constraints on EFT four top contact interaction operators, setting limits on their Wilson coefficients
