Hadron Spectrum Collaboration: spectra from local $q \bar{q}$ constructions

- hybrids found at all masses from light to bottom

$$
m_{\pi}=391 \mathrm{MeV}
$$

[^0]it's very challenging to study the $\pi_{1}(1564)$ using anything like a physical pion mass

- use heavier-than-physical pions
what does this tell us?
- eg K*(892)

$$
t \sim \frac{c^{2}}{s_{0}-s}
$$

- pole coupling hardly changes
- similar for rho, $b_{1}, f_{2}$

$$
\begin{aligned}
m_{\pi}=391 \mathrm{MeV} \quad \pi_{1} & \rightarrow \pi b_{1} \rightarrow \pi \pi \omega \\
& \rightarrow \pi \pi \phi \\
& \rightarrow \pi \pi \pi \eta \\
& \rightarrow \pi K \bar{K}
\end{aligned}
$$

a problem for another day

$$
\begin{aligned}
& m_{\pi}=688 \mathrm{MeV} \\
& \quad m_{u}=m_{d}=m_{s} \\
& m_{\pi}=m_{K}=m_{\eta^{8}}
\end{aligned}
$$

much simpler
fewer channels for a first attempt
simple counting $3 * 700 \mathrm{MeV}=2100 \mathrm{MeV}$

- 3 body is pushed off to higher energies

Department of Physics, College of William and Mary, Williamsburg, VA 23187, USA
(Dated: 21 September 2020)
We present the first determination of the hadronic decays of the lightest exotic $J^{P C}=1^{-+}$ resonance in lattice QCD. Working with $\operatorname{SU}(3)$ flavor symmetry, where the up, down and strange quark masses approximately match the physical strange-quark mass giving $m_{\pi} \sim 700 \mathrm{MeV}$, we compute finite-volume spectra on six lattice volumes which constrain a scattering system featuring eight coupled channels. Analytically continuing the scattering amplitudes into the complex energy plane, we find a pole singularity corresponding to a narrow resonance which shows relatively weak coupling to the open pseudoscalar-pseudoscalar, vector-pseudoscalar and vector-vector decay Attempting a simple extrapolation of the one kinematically-closed axial-vector-pseudoscalar chancel resonance decaying dominantly through the $b_{1} \pi$ mode with much smaller decays into $f_{1} \pi, \rho \pi, \eta^{\prime} \pi$ and $\eta \pi$. A large total width is potentially in agreement with the experimental $\pi_{1}(1564)$ candidate state, observed in $\eta \pi, \eta^{\prime} \pi$, which we suggest may be heavily suppressed decay channels.

anisotropic ( 3.5 finer spacing in time) Wilson-Clover
$L / a_{s}=12,14,16,18,20,24$
$\mathrm{m}_{\pi}=688 \mathrm{MeV}$
this study - total momentum zero irreps only sufficient energy levels from 6 volumes moving frames have a rich, dense spectrum
operators used:

$$
\begin{aligned}
& \bar{\psi} \Gamma \overleftrightarrow{D} \ldots \overleftrightarrow{D} \psi \text { local qq-like constructions } \\
& (\bar{\psi} \boldsymbol{\Gamma} \psi)_{i}=\underbrace{\sum_{\vec{p}_{1}+\vec{p}_{2} \in \vec{p}} C\left(\vec{p}_{1}, \vec{p}_{2} ; \vec{p}\right) \Omega_{\pi}\left(\vec{p}_{1}\right) \Omega_{\pi}\left(\vec{p}_{2}\right) \quad \begin{array}{l}
\text { two-hadron } \\
\text { constructions }
\end{array}}_{1_{i--\otimes 1^{+-} \rightarrow 1^{-+}}^{\epsilon_{i j k}\left(\bar{\psi} \gamma_{j} \psi\right) B_{k}}, \quad \begin{array}{c}
\quad \begin{array}{l}
\text { includes hybrid-like } \\
\text { constructions }
\end{array} \\
B_{k} \propto \epsilon_{k p q}\left[\overleftrightarrow{D_{p}}, \overleftrightarrow{D_{q}}\right]
\end{array}} \\
& \Omega_{\pi}^{\dagger}=\sum_{i} v_{i} \mathcal{O}_{i}^{\dagger} \quad \begin{array}{l}
\text { uses the eigenvector from the } \\
\text { variational method performed in } \\
\text { e.g. pion quantum numbers }
\end{array}
\end{aligned}
$$

using distillation (Peardon et al 2009) many wick contractions

- we compute a large correlation matrix
- then use GEVP to extract energies

amplitude variations - off-diagonal t-matrix elements
perhaps more familiar :

$$
\begin{aligned}
\eta^{\prime} \pi & \rightarrow \rho \pi \\
& \rightarrow K^{\star} \bar{K}
\end{aligned}
$$

in the region of a pole

$$
t \sim \frac{c^{2}}{s_{0}-s}
$$

narrow resonance

$$
\begin{aligned}
a_{t} \sqrt{s} & =0.4606(26) \pm \frac{i}{2} 0.0039(39) \\
\sqrt{s} & =\left(2144(12) \pm \frac{i}{2} 18(18)\right) \mathrm{MeV}
\end{aligned}
$$

small imaginary part, consistent with zero in
some parameterisations
many sheets ( $2^{n}$ )
pole is located on "proximal" sheet
open channels: $\operatorname{Im} k_{i}<0$
closed channels: $\operatorname{Im} k_{i}>0$
in the region of a pole

$$
t \sim \frac{c^{2}}{s_{0}-s}
$$

narrow resonance

$$
\begin{aligned}
a_{t} \sqrt{s} & =0.4606(26) \pm \frac{i}{2} 0.0039(39) \\
\sqrt{s} & =\left(2144(12) \pm \frac{i}{2} 18(18)\right) \mathrm{MeV}
\end{aligned}
$$

small imaginary part, consistent with zero in some parameterisations
many sheets ( $2^{n}$ )

Flavour decomposition

- break apart SU(3) multiplets
- use CGs e.g. from de Swart (Rev. Mod. Phys. 35, 916 (1963))
- mixing angles needed for singlets taken from PDG
very heavy quarks
- crudely extrapolate to physical pions
scale couplings:

$$
\begin{aligned}
& |c|^{\text {phys }}=\left|\frac{k^{\text {phys }}\left(m_{R}^{\text {phys }}\right)}{k\left(m_{R}\right)}\right|^{\ell}|c| \\
& \text { choose } m_{R}=1563 \mathrm{MeV}
\end{aligned}
$$

$$
\rho \rightarrow \pi \pi
$$

$K^{*} \rightarrow K \pi$

evidence for weakly varying couplings as a function of $m_{\pi}$ in several cases

- seems reasonable to scale couplings to estimate properties of the $\pi_{1}$
consider $\mathrm{I}=1, \mathrm{I}_{\mathrm{z}}=+1$ component $\pi_{1}{ }^{+}$
begin with experimentally observed decay modes: $\eta \pi, \eta^{\prime} \pi$
just one component:

$$
\begin{aligned}
& \eta^{\mathbf{1}} \eta^{\mathbf{8}} \mathbf{1} \times \mathbf{8} \rightarrow \mathbf{8} \\
& \pi_{1} \rightarrow \pi \eta_{1}
\end{aligned}
$$

rotate $\eta_{1}$ to physical states:

$$
\binom{\eta_{8}}{\eta_{1}}=\left(\begin{array}{cc}
\cos \theta_{P} & \sin \theta_{P} \\
-\sin \theta_{P} & \cos \theta_{P}
\end{array}\right)\binom{\eta}{\eta^{\prime}} \quad \theta_{P} \sim-10^{\circ}
$$

couplings are then:

$$
\begin{aligned}
\left|c\left(\pi_{1} \rightarrow \eta \pi\right)\right|=\mid c_{\eta^{\mathbf{1}} \eta^{8} \sin \theta_{P} \mid} \quad \text { decay of } \eta^{\prime} \pi>\eta \pi \\
\left|c\left(\pi_{1} \rightarrow \eta^{\prime} \pi\right)\right|=\left\lvert\, c_{\eta^{\mathbf{1}} \eta^{8} \operatorname{COS} \theta_{P} \mid} \begin{array}{l}
\text { coupling at } m_{\pi}=688 \mathrm{MeV} \\
\text { scale to lighter masses }
\end{array}\right.
\end{aligned}
$$

Flavour decomposition

\end{aligned}
$$

For the first time, we have a QCD computation of a $\boldsymbol{\pi}_{1}$ resonance

- a heavier than physical pion mass was used with $m_{u}=m_{d}=m_{s}$
- multibody decay modes are suppressed, only 2-body becomes relevant
- we find large coupling to a kinematically-closed axial-vector-pseudoscalar channel
- narrow resonance at $m_{\pi}=688 \mathrm{MeV}$

Extrapolating to the experimentally-observed mass, we find

- the dominant decay mode appears to be $b_{1} \pi$
- in experiment this is a $5 \pi$ final state
- current analyses of $\eta \pi$ and $\eta^{\prime} \pi$ channels may be quite suppressed w.r.t. $b_{1} \pi$
- broad resonance

This SU(3) calculation has components that apply to the other elements of the octet

- but other components are expected to also contribute (eg singlet in $\eta_{1}$ )
- nevertheless - there's likely to be a family of hybrids

Charmonium, bottomonium is another interesting place to look

- heavier quarks may make extrapolating to the experimental masses more straightforward

[^0]:    $a_{t} m=1.6666(1) \quad a_{t} m=1.7657(7) \quad a_{t} m=1.8028(16) a_{t} m=1.8120(15) a_{t} m=1.8368(21) a_{t} m=1.8957(58) a_{t} m=1.9104(59) a_{t} m=1.9216(37) a_{t} m=1.9370(40) a_{t} m=1.9470(80)$
