## SIDIS in Hall C at Higher Energies

Dave Gaskell<br>Opportunities With JLab Energy and Luminosity Upgrade September 26-30, 2022

1. Hall C 6 and 12 GeV SIDIS Results/Program
2. Measurements at Higher Energy

## SIDIS with Modest Acceptance

Hall C uses magnetic focusing spectrometers with moderate acceptance

Optimal program:
$\rightarrow$ Targeted measurements in specific regions of phase space (i.e., low rate processes)
$\rightarrow$ Absolute cross sections, L-T separations, charge ratios

Complementary to large acceptance devices that can access large phase space all at once

Excellent control of point-to-point systematic uncertainties required for precise L-T separations

Identical acceptance for positive and negative polarity
$\rightarrow$ Precision measurement of charged meson ratios
$\rightarrow$ Ideally suited for focusing spectrometers
$\rightarrow$ One of the drivers for SHMS design

## SHMS and HMS in Experimental Hall C

## Spectrometer properties

HMS: Electron arm
Nominal capabilities:
$\mathrm{d} \Omega \sim 6 \mathrm{msr}, P_{0}=0.5-7 \mathrm{GeV} / \mathrm{c}$
$\theta_{0}=10.5$ to 80 degrees
$e$ ID via calorimeter and gas
Cherenkov
SHMS: Pion arm
Nominal capabilities:
$\mathrm{d} \Omega \sim 4 \mathrm{msr}, P_{0}=1-11 \mathrm{GeV} / \mathrm{c}$
$\theta_{0}=5.5$ to 40 degrees
m:K:p separation via heavy gas
Cherenkov and aerogel
detectors

## Neutral Particle Spectrometer (NPS)

Calorimeter + sweeper magnet adds capability to detect neutral particles: $\gamma$ and $\pi^{0}$
$\rightarrow$ NPS mounted on SHMS carriage - allows easy angle changes
$\rightarrow$ In addition to broadening SIDIS program, enables DVCS, DVMP $\left(\pi^{0}\right)$, WACS measurements

$\pi^{0}$ avoids complications from vector meson decay, smaller radiative tails from exclusive pion production

NPS installation will begin in spring 2023

## Hall C SIDIS Results from 6 GeV

E10-008: SIDIS $\pi+/ \pi-$ cross sections and ratios

T. Navasardyan et al. PRL 98, 022001

Surprisingly consistent with expectations from higher energy experiments

R. Asaturyan et al. Phys. Rev. C 85, 015202

## Hall C SIDIS Results from 6 GeV

Hall C experiment E00-108 (6 GeV):
$\rightarrow$ Measured $\mathrm{P}_{\mathrm{T}}$ dependent cross sections in semiinclusive pion production
$\rightarrow$ Measured both $\pi+$ and $\pi$ -
$\rightarrow$ Proton and deuteron (neutron) targets
$\rightarrow$ Combination allows (in principle) disentanglement of quark and fragmentation widths

Simple model, with several assumptions:
$\rightarrow$ factorization valid
$\rightarrow$ fragmentation functions do not depend on quark flavor
$\rightarrow$ transverse momentum widths of quark and fragmentation functions are Gaussian and can be added in quadrature
$\rightarrow$ more ...

## Hall C @ 12 GeV- $\mathrm{P}_{\mathrm{T}}$ Dependent Cross Sections

## E12-09-017: $P_{T}$ Dependance of $\pi^{\dagger-}$ Production

$$
\sigma=\sum_{q} e_{q}^{2} f(x) \otimes D(z)
$$

Precise cross section measurements with HMS and SHMS
$\rightarrow$ Demonstrate understanding of reaction mechanism, test factorization
$\rightarrow$ Able to carry out precise comparisons of charge states, $\pi+/ \pi-$
$\rightarrow$ Can do meaningful measurements at low $p_{T}$ (down to 0.05 GeV ) due to excellent momentum and angle resolutions!

## HMS-SHMS $P_{T} / \phi$ acceptance

Simulated, from $\mathrm{P}_{\mathrm{T}}$-SIDIS experiment $(11 \mathrm{GeV})$

Full $\phi$ coverage over limited $P_{T}$ range $\rightarrow$ larger $P_{T}$ covers narrow range in $\phi$

## 11 GeV SIDIS Preliminary Analysis

Multpilicites
$\rightarrow$ Data with and without diffractive $\rho$ subtraction
$\rightarrow$ Curves: DSS FF w/cteq PDFs

## 11 GeV SIDIS Preliminary Analysis

## $P_{T}$ widths

$\rightarrow$ Data with and without diffractive $\rho$ subtraction
$\rightarrow$ Curves:
$\left\langle\mathrm{P}_{\mathrm{T}^{2}}\right\rangle=\left\langle\mathrm{pt}^{2}\right\rangle+\mathrm{z}^{2}\left\langle\mathrm{k}_{\mathrm{T}}{ }^{2}\right\rangle$
$\left\langle\mathrm{P}_{\mathrm{T}}{ }^{2}\right\rangle$ and $\left\langle\mathrm{k}_{\mathrm{T}}{ }^{2}\right\rangle$ taken to be $0.2 \mathrm{GeV}^{2}$

$$
y=M_{0} b e^{-b p_{T}^{2}}\left(1+A p_{T} \cos \phi\right)
$$

## 11 GeV SIDIS Preliminary Analysis

Cos(phi) term:
$\rightarrow$ Data with and without diffractive $\rho$ subtraction
$\rightarrow$ "A" generally close to zero or positive
$\rightarrow$ Cahn effect would give A<0

Analysis from Peter Bosted

$$
y=M_{0} b e^{-b p_{T}^{2}}\left(1+A p_{T} \cos \phi\right)
$$

## Hall C @ 12 GeV - Precise $\pi^{+} / \pi^{r}$ Ratios (low $\mathrm{P}_{\mathrm{T}}$ )

E12-09-002: Charge Symmetry Violating Quark Distributions via $\pi^{+} / \pi$ in SIDIS

Ratio of $\pi^{+} / \pi$ cross sections sensitive to CSV quark distributions

$$
R_{Y}(x, z)=\frac{Y^{D \pi^{-}}(x, z)}{Y^{D \pi^{+}}(x, z)} \quad \begin{aligned}
& \delta d-\delta u \quad \text { where } \\
& \delta d=d^{p}-u^{n} \text { and } \delta u=u^{p}-d^{n}
\end{aligned}
$$

$\frac{\mathrm{H}\left(\pi^{+}+\pi^{-}\right)}{\mathrm{D}\left(\pi^{+}+\pi^{-}\right)}$

## Hall C 12 GeV: $R=\sigma_{L} / \sigma_{T}$ in SIDIS

$$
\begin{aligned}
\frac{d \sigma}{d x d y d \psi d z d \phi_{h} d P_{h, t}^{2}}=\frac{\alpha^{2}}{x y Q^{2}} \frac{y^{2}}{2(1-\varepsilon)}\left(1+\frac{\gamma^{2}}{2 x}\right)\left\{F_{U U, T}+\varepsilon F_{U U, L}+\right. \\
\left.\sqrt{2 \varepsilon(1+\varepsilon)} \cos \phi_{h} F_{U U}^{\cos \phi_{h}}+\varepsilon \cos \left(2 \phi_{h}\right) F_{U U}^{\cos \left(2 \phi_{h}\right)}+\lambda_{e} \sqrt{2 \varepsilon(1+\varepsilon)} \sin \phi_{h} F_{L U}^{\sin \phi_{h}}\right\}
\end{aligned}
$$

$\rightarrow$ integrate over $\phi$, unpolarized beam, only $L$ and $T$ terms remain DIS $\rightarrow F\left(x, Q^{2}\right) \quad$ SIDIS $\rightarrow F\left(x, Q^{2}, z, P_{T}\right)$

Knowledge of $R=\sigma_{L} / \sigma_{T}$ in SIDIS is essentially non-existing!
Integrated over z, $p_{T}$, hadron species $R_{S I D / S} \rightarrow R_{D / S}$
$\rightarrow R_{\text {SIDIS }}$ may vary with $z, p_{T}$
$\rightarrow$ Is $R_{\text {SIDIS }}$ the same for $\pi^{+}, \pi^{-}\left(\mathrm{K}^{+}, \mathrm{K}^{-}\right)$? H and D ?
$\rightarrow R_{S I D I S}=R_{D I S}$ a test of quark fragmentation
$\rightarrow$ How does $R$ transition from SIDIS to exclusive?

## Hall C 12 GeV SIDIS Program - L-T Separations

E12-06-104: Measurement of the Ratio $\mathrm{R}=\sigma_{\mathrm{L}} / \sigma_{T}$ in Semi-Inclusive Deep-Inelastic Scattering

Precise measurements of $R_{\text {SIDIS }}$ in

$$
e+p \rightarrow e^{\prime}+\pi^{+/-+} X, e+D \rightarrow e^{\prime}+\pi^{+/-+X}
$$

$L-T$ separation requires excellent understanding of acceptance, control of point-to-point systematic errors
$\rightarrow$ ideally suited to Hall C equipment at 12 GeV

1. Scans in $z$ at $Q^{2}=2.0(x=0.2)$ and $4.0 \mathrm{GeV}^{2}(x$ $=0.4) \rightarrow$ behavior of $\sigma_{L} / \sigma_{T}$ for large $z$.
2. Cover $Q^{2}=1.5-5.0 \mathrm{GeV}^{2}, \rightarrow$ both H and D at $Q^{2}=2 \mathrm{GeV}^{2}$
3. $P_{T}$ up to $\sim 1 \mathrm{GeV}$. Coverage in $\phi$ is excellent (o.k.) up to $P_{T}=0.2(0.4) \mathrm{GeV}$.

## $\mathbf{R}=\sigma_{\mathrm{L}} / \sigma_{\mathrm{T}}$ in SIDIS (ep $\rightarrow \mathrm{e}^{\prime} \pi^{+/-\mathrm{X}}$ )

$\leadsto$

## 12 GeV Hall C SIDIS Program - HMS+SHMS

Accurate cross sections for validation of SIDIS
factorization framework and for L/T separations

## 12 GeV Hall C SIDIS Program - HMS+SHMS+NPS

Accurate cross sections for validation of SIDIS
factorization framework and for L/T separations

## Charged pions:

$\square$ E12-06-104
$\mathrm{L} / \mathrm{T}$ scan in ( $\mathrm{z}, \mathrm{P}_{\mathrm{T}}$ ) No scan in $\mathrm{Q}^{2}$ at fixed x : $\mathrm{R}_{\mathrm{DIS}}\left(\mathrm{Q}^{2}\right)$ known

- E12-09-017

Scan in ( $x, z, P_{T}$ )

+ scan in $Q^{2}$ at fixed x

E12-09-002

+ scans in z

## 22 GeV Hall C SIDIS Phase Space - HMS+SHMS

Assumptions: HMS + SHMS minimum angle constraints unchanged
$\rightarrow$ Increase in HMS maximum momentum (higher field magnets)
$\rightarrow$ Smaller HMS angle may be possible, but would require special bender like SHMS

| 6 GeV |
| :--- |
| phase |
| space |

18 GeV phase
space
22 GeV phase
space

Possible Measurements
$\rightarrow$ Additional L-T
separations: expanded $x / Q^{2}$
$\rightarrow$ Large $P_{T}$, cross sections and ratios in particular phase space
$\rightarrow$ Measurements of cross sections and ratios at largest $Q^{2}$ and $x$

## Measurements at 22 GeV : Parallel Kinematics

HMS+SHMS has excellent momentum/angle resolution
$\rightarrow$ Complete $\phi$ coverage at low $P_{T}$

| $x$ | $Q 2$ | $z$ |
| :--- | :--- | :--- |
| 0.26 | 7 | $0.4-0.7$ |
| 0.37 | 10 | $0.4-0.7$ |
| 0.38 | 12 | $0.36-0.64$ |
| 0.51 | 17 | $0.33-0.58$ |
| 0.54 | 15 | $0.4-0.7$ |

$P_{T}=0-0.5$
$W^{\prime}>2 \mathrm{GeV}$ for
all settings

$\sim 45$ days
assuming $70 \mu \mathrm{~A}$

No modifications to either HMS or SHMS needed for these measurements

Projections from Peter Bosted

## Hall C SIDIS Phase Space - Smaller HMS angle

## Measurements at 22 GeV : Large $P_{T}$

Access to large $P_{T}$ by rotating SHMS away from q-vector $\rightarrow$ Interference term contribution difficult to constrain $\rightarrow$ Complicates possible L-T separations

This $\mathrm{x} / \mathrm{Q}^{2}$ assumes upgraded HMS
$\frac{d \sigma}{d x d y d z d p_{T}^{2} d \phi}=\frac{\alpha^{2}}{x y Q^{2}} \frac{y^{2}}{2(1-\epsilon)}\left[F_{T}+\epsilon F_{L}+\sqrt{2 \epsilon(1+\epsilon)} \cos \phi F_{L T}+\epsilon \cos 2 \phi F_{T T}\right]$

Jefferson Lab
Projected rates
$\rightarrow 10 \mathrm{~cm}$ LH2 target
$\rightarrow 80 \mu \mathrm{~A}$
$\rightarrow 40 \mathrm{MeV}$ bins in $\mathrm{P}_{\mathrm{T}}$
$\Delta \varepsilon=0.36$ possible if L-T separation desired

## Hall C Program at Higher Energy

- Higher energy capabilities extends 12 GeV program to larger $x, Q^{2}$
- Precision cross sections
- L/T separations
- Low rate processes $\rightarrow$ large $P_{T}$
- Precision ratios ( $\pi+/ \pi$-, and more)
- Excellent $\pi / K / p$ separation
- Neutral particle capabilities w/calorimeter (NPS)
- Upgraded equipment ?
- Program could be carried out at 22 GeV w/existing HMS and SHMS (and NPS)
- Higher momentum capability for electron arm (upgraded HMS?) would be beneficial
- Smaller angle capability $\rightarrow$ needed for access to lower $x$, anti-shadowing region

## SHMS and SBS?

Super Big Bite Spectrometer built and being used in Hall A
$\rightarrow$ Dipole with large gap and large area detector stack
$\rightarrow$ Can be positioned a various positions/distances from the pivot
$\rightarrow$ Access very small angle by pushing the spectrometer far from pivot

$$
\begin{aligned}
& \Delta \Omega=12 \mathrm{msr} \text { at } 5 \text { degrees } \\
& \Delta \Omega=72 \mathrm{msr} \text { at } 15 \text { degrees } \\
& \mathrm{P}=2-10 \mathrm{GeV} / \mathrm{c}
\end{aligned}
$$

SBS could be paired with SHMS in Hall C $\rightarrow$ need new or raised stand $\rightarrow$ Not ideal for L/T separations, but cross sections, ratios still accessible

## EXTRA

Jefferson Lab

## E12-09-017 Kinematics (proposal)

## Hall C SIDIS Results from 6 GeV

Used $P_{T}$ dependence of unpolarized cross sections to place constraints on up/down quark, favored/unfavored FF widths

R. Asaturyan et al. Phys. Rev. C 85, 015202

Frag. Function widths

## Transverse Momentum Dependence of SIDIS

Unpolarized $\mathrm{k}_{\mathrm{T}}$-dependent SIDIS: in framework of Anselmino et al [hep-ph/0608048], described in terms of convolution of quark distributions $f$ and (one or more) fragmentation functions $D$, each with own characteristic (Gaussian) width

$$
\begin{aligned}
& f_{1}^{q}\left(x, k_{T}\right)=f_{1}(x) \frac{1}{\pi \mu_{0}^{2}} \exp \left(-\frac{k_{T}^{2}}{\mu_{0}^{2}}\right)^{4} \longleftarrow \mu_{0} \text { describes transverse momentum of quarks } \\
& D_{1}^{q}\left(z, p_{T}\right)=D_{1}(z) \frac{1}{\pi \mu_{D}^{2}} \exp \left(-\frac{p_{T}^{2}}{\mu_{D}^{2}}\right) \longleftarrow \mu_{D} \text { describes } p_{T} \text { dependence of Frag. Func. }
\end{aligned}
$$

(assuming $\mu_{0, \mathrm{u}}=\mu_{0, \mathrm{~d}}$ )

$$
\left[1+(1-y)^{2}-4(2-y) \sqrt{1-y} \frac{z \mu_{0}^{2}\left|\mathbf{P}_{h T}\right|}{Q\left(\mu_{D}^{2}+\mu_{0}^{2} z^{2}\right)} \cos \varphi_{h}\right] \frac{\exp \left(-\frac{\mathbf{P}_{h T}^{2}}{\mu_{D}^{2}+\mu_{0}^{2} z^{2}}\right)}{\mu_{D}^{2}+\mu_{0}^{2} z^{2}} \sum_{q} e_{q}^{2} f_{1}^{q}(x) D_{q}^{h}(z)
$$

Possibility to constrain $\mathrm{k}_{\mathrm{T}}$ dependence of up and down quarks separately by combination of $\pi^{+}$and $\pi^{-}$final states, proton and deuteron targets

## $R=\sigma_{L} / \sigma_{T}$ in SIDIS (ep $\left.\rightarrow \mathrm{e}^{\prime} \pi \mathrm{X}\right)$

Cornell data of 70's

Conclusion: "data both consistent with $R=0$ and $R=" R_{D I S}$ "

Some hint of large $R$ at large $z$ in Cornell data?

## 11 GeV SIDIS Preliminary Analysis

Cross sections fit to the form:
$y=M_{0} b e^{-b p_{T}^{2}}\left(1+A p_{T} \cos \phi\right)$
