Christian Schilling (LMU, Munich), Carlos L Benavides-Riveros (MPIPKS Dresden), Adam Sawicki (CTP PAS, Warsaw), David Gross & Alexandre Lopes (University of Cologne),

Implications of pinned occupation numbers for natural orbital expansions: I & II (2020), New Journal of Physics. 22, 023001 & 023002

Motivation – consider a fermionic interacting system

 $H(\kappa) = h + \kappa V$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

- h single-particle Hamiltonian
- V interaction
- ▶ $\kappa > 0$ − interaction strength

No interactions – Hartree-Fock state

If $\kappa = 0$, then $H \equiv h$.

N-fermion ground state:

$$|HF(h)\rangle = f_{\phi_1}^{\dagger} \dots f_{\phi_N}^{\dagger} |vac\rangle =: |\phi_1, \dots, \phi_N\rangle.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

No interactions – Hartree-Fock state

If $\kappa = 0$, then $H \equiv h$.

N-fermion ground state:

$$|HF(h)\rangle = f_{\phi_1}^{\dagger} \dots f_{\phi_N}^{\dagger} |vac\rangle =: |\phi_1, \dots, \phi_N\rangle.$$

If $\kappa > 0$, then the ground state is in principle a superposition of all the configurations

$$|\Phi_N(\kappa)\rangle = \sum_{i_1 < \dots < i_N} c_{i_1,\dots,i_N}(\kappa) |\phi_{i_1},\dots,\phi_{i_N}\rangle \in \Lambda^N\left(\mathbb{C}^D\right).$$

Back to $\kappa = 0$

$$|HF(h)\rangle = f_{\phi_1}^{\dagger} \dots f_{\phi_N}^{\dagger} |vac\rangle =: |\phi_1, \dots, \phi_N\rangle$$

Complete active space ansatz

 $H(\kappa) = h + \kappa V, \quad \kappa << 1$

Complete active space ansatz

$$|\Psi_n\rangle = \sum_{1 < i_1 < \dots < i_n < d} c_{i_1,\dots,i_n} |\chi_{i_1},\dots,\chi_{i_n}\rangle \in \Lambda^n \left(\mathbb{C}^d\right).$$

Complete active space self consistent field ansatz

$$|\Psi_n\rangle = \sum_{i_1 < \cdots < i_n} c_{i_1, \dots, i_n} |\chi_{i_1}, \dots, \chi_{i_n}\rangle \in \Lambda^n \left(\mathbb{C}^d\right).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Complete active space self consistent field ansatz:

- optimisation over the coefficients c_{i1},...,i_n,
- optimisation over the active orbitals $|\chi_1\rangle, \ldots, |\chi_d\rangle$.

Complete active space self consistent field ansatz

$$|\Psi_n\rangle = \sum_{i_1 < \cdots < i_n} c_{i_1, \dots, i_n} |\chi_{i_1}, \dots, \chi_{i_n}\rangle \in \Lambda^n \left(\mathbb{C}^d\right).$$

Complete active space self consistent field ansatz:

- optimisation over the coefficients c_{i1},...,i_n,
- optimisation over the active orbitals $|\chi_1\rangle, \ldots, |\chi_d\rangle$.

Multi configurational self consistent field ansatz:

- only a subset of all configurations $|\chi_{i_1}, \ldots, \chi_{i_n}\rangle$ enters the ansatz $|\Psi_n\rangle$,
- optimisation over the the coefficients and the active orbitals $|\chi_1\rangle, \ldots, |\chi_d\rangle$.

Multi configurational self consistent field ansatz optimisation

$$\Psi_n \rangle = \sum_{(i_1, \dots, i_n) \in \mathcal{I}} c_{i_1, \dots, i_n} |\chi_{i_1}, \dots, \chi_{i_n} \rangle, \quad |\chi_k \rangle = \sum_l U_{kl} |\psi_k \rangle,$$

$$E_{MCSCF} = \min_{c_{i_1,\dots,i_n},U} \langle \Psi_n | H | \Psi_n \rangle.$$

Multi configurational self consistent field ansatz optimisation

$$\Psi_n \rangle = \sum_{(i_1, \dots, i_n) \in \mathcal{I}} c_{i_1, \dots, i_n} |\chi_{i_1}, \dots, \chi_{i_n} \rangle, \quad |\chi_k \rangle = \sum_l U_{kl} |\psi_k \rangle,$$

$$E_{MCSCF} = \min_{c_{i_1,\dots,i_n},U} \langle \Psi_n | H | \Psi_n \rangle.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Potential issues:

- computing $\langle \Psi_n | H | \Psi_n \rangle$ in different orbital bases,
- convergence of the minimisation,
- large number of configurations $\binom{d}{n}$.

Multi configurational self consistent field ansatz optimisation

$$\Psi_n \rangle = \sum_{(i_1, \dots, i_n) \in \mathcal{I}} c_{i_1, \dots, i_n} |\chi_{i_1}, \dots, \chi_{i_n} \rangle, \quad |\chi_k \rangle = \sum_l U_{kl} |\psi_k \rangle,$$

$$E_{MCSCF} = \min_{c_{i_1,\dots,i_n},U} \langle \Psi_n | H | \Psi_n \rangle.$$

Potential issues:

- computing $\langle \Psi_n | H | \Psi_n \rangle$ in different orbital bases,
- convergence of the minimisation,
- large number of configurations $\binom{d}{n}$.

This talk

A systematic construction of ansatz states that involves few configurations relative to the active Hilbert space size $\binom{d}{n}$.

Natural orbitals & natural occupation numbers

The one-fermion reduced density matrix

 $\rho_{ij}\left(|\Psi_n\rangle\right) = \langle \Psi_n | f_{\chi_j}^{\dagger} f_{\chi_i} | \Psi_n \rangle.$

The $d \times d$ matrix $\rho(|\Psi_n\rangle)$ can be diagonalised:

$$\rho\left(|\Psi_n\rangle\right) = \sum_{k=1}^d n_k |k\rangle \langle k|$$

so that $n_1 \geq n_2 \geq \cdots \geq n_d$.

Natural orbitals & natural occupation numbers

The one-fermion reduced density matrix

 $\rho_{ij}\left(|\Psi_n\rangle\right) = \langle \Psi_n | f_{\chi_j}^{\dagger} f_{\chi_i} | \Psi_n \rangle.$

The $d \times d$ matrix $\rho(|\Psi_n\rangle)$ can be diagonalised:

$$\rho\left(|\Psi_n\rangle\right) = \sum_{k=1}^d n_k |k\rangle \langle k|$$

so that $n_1 \geq n_2 \geq \cdots \geq n_d$.

Numbers n_1, \ldots, n_d are the **natural occupation numbers**.

• Orbitals $|1\rangle, \ldots, |d\rangle$ are the **natural orbitals**.

Pauli constraints

Consider the map:

 $\Lambda^n \left(\mathbb{C}^d \right) \ni |\Psi_n\rangle \to \rho \left(|\Psi_n\rangle \right) \to (n_1, \dots, n_d), \quad n_1 \ge n_2 \ge \dots \ge n_d.$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Pauli constraints

Consider the map:

 $\Lambda^n\left(\mathbb{C}^d\right) \ni |\Psi_n\rangle \to \rho\left(|\Psi_n\rangle\right) \to (n_1,\ldots,n_d), \quad n_1 \ge n_2 \ge \cdots \ge n_d.$

Question: What is the image of the map $|\Psi_n\rangle \rightarrow (n_1, \dots, n_d)$?

Pauli constraints

Consider the map:

 $\Lambda^n\left(\mathbb{C}^d\right) \ni |\Psi_n\rangle \to \rho\left(|\Psi_n\rangle\right) \to (n_1,\ldots,n_d), \quad n_1 \ge n_2 \ge \cdots \ge n_d.$

Question: What is the image of the map $|\Psi_n
angle o (n_1, \dots, n_d)$?

It is contained in the *d*-dimensional hypercube $0 \le n_k \le 1$, $k = 1, \ldots, d$.

A CASSCF ansatz \equiv saturation of Pauli constraints.

A CASSCF ansatz \equiv saturation of Pauli constraints.

• Core orbitals: $n_k = 1, k = 1, \dots, d_{core}$.

A CASSCF ansatz \equiv saturation of Pauli constraints.

- Core orbitals: $n_k = 1, k = 1, \ldots, d_{core}$.
- Virtual orbitals: n_k = 0, k > d_{core} + d, d number of active orbitals.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

A CASSCF ansatz \equiv saturation of Pauli constraints.

- Core orbitals: $n_k = 1, k = 1, \ldots, d_{core}$.
- Virtual orbitals: n_k = 0, k > d_{core} + d, d number of active orbitals.

This leaves the effective Hibert space

 $\Lambda^n\left(\mathbb{C}^d\right)$

of $n = N - d_{core}$ active electrons distributed on d active orbitals.

A CASSCF ansatz \equiv saturation of Pauli constraints.

- Core orbitals: $n_k = 1, k = 1, \ldots, d_{core}$.
- Virtual orbitals: n_k = 0, k > d_{core} + d, d number of active orbitals.

This leaves the effective Hibert space

 $\Lambda^n\left(\mathbb{C}^d\right)$

of $n = N - d_{core}$ active electrons distributed on d active orbitals.

Strategy: Start with small n, d and incrementally increase the size of the active space and the number of active electrons.

The Pauli constraints $0 \le n_k \le 1$ are not the only ones! (On top of ordering $n_1 \ge \cdots \ge n_d$ and normalisation $n_1 + \cdots + n_d = n$).

So defined ansatz states contain very few configurations.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

Task: Find configurations $|i_1, i_2, i_3\rangle$ satisfying

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 = 9.$

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

Task: Find configurations $|i_1, i_2, i_3\rangle$ satisfying

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 = 9.$

Try: $|2,4,6\rangle$, i.e.

 $n_1 = n_3 = n_5 = n_7 = n_8 = 0, \quad n_2 = n_4 = n_6 = 1.$

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

Task: Find configurations $|i_1, i_2, i_3\rangle$ satisfying

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 = 9.$

Try: $|2,4,6\rangle$, i.e.

 $n_1 = n_3 = n_5 = n_7 = n_8 = 0, \quad n_2 = n_4 = n_6 = 1.$

 $19 \cdot 0 + 11 \cdot 1 - 21 \cdot 0 - 13 \cdot 1 - 5 \cdot 0 - 5 \cdot 1 + 3 \cdot 0 + 11 \cdot 0 = 11 - 13 - 5 = -7 \neq 9.$

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

Task: Find configurations $|i_1, i_2, i_3\rangle$ satisfying

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 = 9.$

Try: $|2, 4, 6\rangle$, i.e.

 $n_1 = n_3 = n_5 = n_7 = n_8 = 0, \quad n_2 = n_4 = n_6 = 1.$

19.0+11.1-21.0-13.1-5.0-5.1+3.0+11.0 = 11−13−5 = $-7 \neq 9$. Configuration $|2,4,6\rangle$ does not enter the ansatz!

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

Task: Find configurations $|i_1, i_2, i_3\rangle$ satisfying

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 = 9.$

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

Task: Find configurations $|i_1, i_2, i_3\rangle$ satisfying

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 = 9.$

Try: $|1, 5, 6\rangle$, i.e.

 $n_2 = n_3 = n_4 = n_7 = n_8 = 0, \quad n_1 = n_5 = n_6 = 1.$

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

Task: Find configurations $|i_1, i_2, i_3\rangle$ satisfying

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 = 9.$

Try: $|1, 5, 6\rangle$, i.e.

 $n_2 = n_3 = n_4 = n_7 = n_8 = 0, \quad n_1 = n_5 = n_6 = 1.$

 $19 \cdot 1 + 11 \cdot 0 - 21 \cdot 0 - 13 \cdot 0 - 5 \cdot 1 - 5 \cdot 1 + 3 \cdot 0 + 11 \cdot 0 = 19 - 5 - 5 = 9.$

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

Task: Find configurations $|i_1, i_2, i_3\rangle$ satisfying

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 = 9.$

Try: $|1, 5, 6\rangle$, i.e.

 $n_2 = n_3 = n_4 = n_7 = n_8 = 0, \quad n_1 = n_5 = n_6 = 1.$

 $19 \cdot 1 + 11 \cdot 0 - 21 \cdot 0 - 13 \cdot 0 - 5 \cdot 1 - 5 \cdot 1 + 3 \cdot 0 + 11 \cdot 0 = 19 - 5 - 5 = 9.$

Configuration $|1, 5, 6\rangle$ does enter the ansatz!

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

The configurations that saturate the inequality are: $|1, 2, 3\rangle$, $|1, 5, 6\rangle$, $|1, 3, 8\rangle$, $|2, 5, 7\rangle$, $|5, 7, 8\rangle$, $|2, 4, 8\rangle$, $|1, 4, 7\rangle$, $|2, 6, 7\rangle$, $|6, 7, 8\rangle$.

So defined ansatz states contain very few configurations.

Example N = 3 and d = 8. Consider a regular face of the polytope:

 $19n_1 + 11n_2 - 21n_3 - 13n_4 - 5n_5 - 5n_6 + 3n_7 + 11n_8 \le 9.$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

The configurations that saturate the inequality are: $|1, 2, 3\rangle$, $|1, 5, 6\rangle$, $|1, 3, 8\rangle$, $|2, 5, 7\rangle$, $|5, 7, 8\rangle$, $|2, 4, 8\rangle$, $|1, 4, 7\rangle$, $|2, 6, 7\rangle$, $|6, 7, 8\rangle$.

Only 9 configurations out of the total of $\binom{8}{3} = 56$.

Methods

Derivation of the ansatz:

- differential-geometric and group-theoretic methods,
- the the map $|\Psi_n\rangle \rightarrow (n_1, \dots, n_d)$ is **singular** on the regular boundary of the polytope,

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Methods

Derivation of the ansatz:

- differential-geometric and group-theoretic methods,
- the the map $|\Psi_n\rangle \to (n_1,\ldots,n_d)$ is **singular** on the regular boundary of the polytope,
- kernel of the derivative matrix is nontrivial \implies constraints for $|\Psi_n\rangle$.

A construction of families of MCSCF variational ansatz states implied by the (quasi)pinning of the natural occupation numbers to the boundary of the spectral polytope.

- A construction of families of MCSCF variational ansatz states implied by the (quasi)pinning of the natural occupation numbers to the boundary of the spectral polytope.
- Advantage: a systematic way of using fewer configurations.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

They still could be used effectively in combination with CASSCF methods.

- A construction of families of MCSCF variational ansatz states implied by the (quasi)pinning of the natural occupation numbers to the boundary of the spectral polytope.
- Advantage: a systematic way of using fewer configurations.
- Advantage: naturally contains CASSCF hierarchy.
- **Disadvantage:** the polytopes are explicitly known only up to $d \leq 11$.
- They still could be used effectively in combination with CASSCF methods.

Outlook:

 Imposing spin conservation symmetries allows to include more spin-orbitals.

Diagonalise $\rho_O(|\Psi_n\rangle)$ to obtain natural orbital occupation numbers $(n_{O,1}, \ldots, n_{O,r})$, $n_{O,1} \ge \cdots \ge n_{O,r}$.

So far, we have considered spinless fermions or spin-orbitals

 $|\chi_{1\uparrow}\rangle, |\chi_{1\downarrow}\rangle, \dots, |\chi_{r\uparrow}\rangle, |\chi_{r\downarrow}\rangle, \quad d = 2r.$

Restrict to the Hilbert space of fixed total spin, S, and fixed total spin-z component, S_z .

The orbital one-electron reduced density matrix (a $r \times r$ matrix) is given by

$$\rho_O\left(|\Psi_n\rangle\right)_{ij} = \langle \Psi_n | \left(f_{j\uparrow}^{\dagger} f_{i\uparrow} + f_{j\downarrow}^{\dagger} f_{i\downarrow}\right) |\Psi_n\rangle.$$

Diagonalise $\rho_O(|\Psi_n\rangle)$ to obtain natural orbital occupation numbers $(n_{O,1}, \ldots, n_{O,r})$, $n_{O,1} \ge \cdots \ge n_{O,r}$. The image of $|\Psi_n\rangle \to (n_{O,1}, \ldots, n_{O,r})$ is again a convex polytope (depends on n, r, S, S_z). Four-electron triplet r = 4 (courtesy of M Altunbulak)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

So far, polytopes up to r = 7 (so 14 spin-orbitals).

Singular faces

Is there an ansatz associated with the face $n_5 = n_6$?

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

Singular faces

Is there an ansatz associated with the face $n_5 = n_6$?

There are states mapped beyond this face, so no ansatz!

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Reflected polytope $n_5 \leftrightarrow n_6$

Face $n_5 = n_6$ is not extremal.

Reflected polytope $n_5 \leftrightarrow n_6$

Face $n_5 = n_6$ is not extremal.

One of the edges is not extremal as well.
Reflected polytope $n_4 \leftrightarrow n_5$

Face $n_4 = n_5$ is not extremal.

This edge is extremal \implies another ansatz!

Degenerate natural occupation numbers

If $|\Psi_n\rangle \to (n_1, \dots, n_d)$ and $n_i = n_{i+1}$, then the choice of natural orbitals $|i\rangle$ and $|i+1\rangle$ is not unique.

 $|i\rangle \rightarrow a |i\rangle + b |i+1\rangle, \quad |i+1\rangle \rightarrow c |i\rangle + d |i+1\rangle.$

Theorem 2° (C Schilling et al 2020 & T Maciazek et al 2020)

Assume $|\Psi_n\rangle \rightarrow (n_1, \ldots, n_d)$ with degenerate (n_1, \ldots, n_d) belonging to exactly one regular face of the polytope given by the inequality

$$A_1 n_1 + \dots + A_n n_d \le B. \tag{1}$$

Then **there exists** a basis of natural orbitals where $|\Psi_n\rangle$ is a linear combination of Slater determinants whose occupation numbers saturate (2).

Degenerate natural occupation numbers

Theorem 2° (C Schilling et al 2020 & T Maciazek et al 2020)

Assume $|\Psi_n\rangle \to (n_1,\ldots,n_d)$ with degenerate (n_1,\ldots,n_d) belonging to exactly one regular face of the polytope given by the inequality

$$A_1 n_1 + \dots + A_n n_d \le B. \tag{2}$$

Then **there exists** a basis of natural orbitals where $|\Psi_n\rangle$ is a linear combination of Slater determinants whose occupation numbers saturate (2).

* correct under a technical combinatorial assumption which we have checked to be satisfied for any system where the generalised Pauli constraints are explicitly known.
