

# Integrated photonics for trapped ions quantum computing

Carmelo Mordini

Trapped Ions Quantum Information  
ETH Zurich

Let's build a quantum computer!

Let's build a quantum computer!

# Surface traps

Surface traps  
**distribute ions** over the chip

Mixed species

*Pino et al. Nature 2021*

*Kielinski et al. Nature 2002*

Linear transport / splitting

*Schmidt-Kahler (review 2020)*  
*(yeah, not a surface trap)*

Junctions

*Quantinuum, 2022*

# Surface traps + integrated photonics

Photonics  
**distribute light** over the chip

Multiple wavelengths

*Niffenegger et al. Nature 2020*

Multiple zones

*Mehta et al. Nature 2020*

# Photonic surface traps at ETH Zürich

# Roadmap

- Single ion operations  
*Mehta et al. Nature Nanotech. 2016*
- Multi-wavelength integration  
*Niffenegger et al. Nature 2020*
- Multi-qubit operations  
*Mehta et al. Nature 2020*
- Engineered light: map of a standing wave  
*Ricci et al. PRL 2023*
- Engineered light: optical potentials
- Multi-zone trapping and transport
- Multi-zone operations
- Multi-(qubit, wavelength, zone) operations

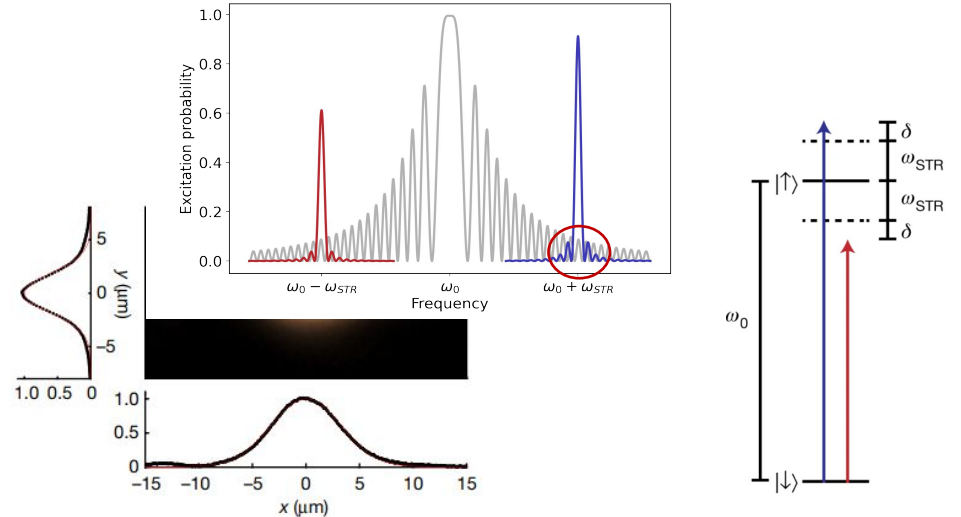

# Multi-qubit operations

## MS gate using integrated photonics (F = 99.3(2)%)

- Beam shape optimized at ions location: high intensity
- No phase noise from vibrations
- Improvement: reduce gate time
  - Requires more laser power
  - Limited by off-resonant exc. of carrier

*Mehta et al. Nature 2020*

Just add one more beam...

# Roadmap

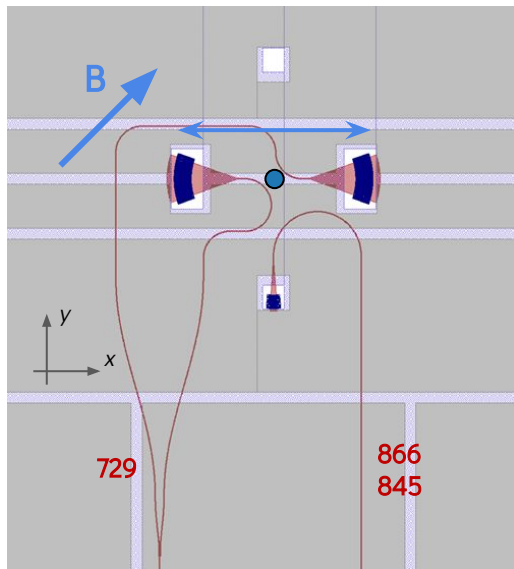

- Single ion operations  
*Mehta et al. Nature Nanotech. 2016*
- Multi-wavelength integration  
*Niffenegger et al. Nature 2020*
- Multi-qubit operations  
*Mehta et al. Nature 2020*
- Engineered light: map of a standing wave  
*Ricci et al. PRL 2023*
- Engineered light: optical potentials
- Multi-zone trapping and transport
- Multi-zone operations
- Multi-(qubit, wavelength, zone) operations

# Coupling 1 ion to a standing wave

- Selectively null carrier or sidebands removing off-resonant coupling  
*Mehta et al. Proc SPIE 2019*
- Requires stable positioning of the ion in the interference pattern
  - In a cavity  
*Mundt et al, PRL (Innsbruck, 2002)*
  - In a stabilized optical lattice  
*Schmiegelow et al, PRL (Mainz, 2016)*  
*WIP in D. Lucas group (Oxford)*
- With integrated beams
  - Standing/running wave
  - Passive stability
- Experiment: scan 1 ion through the SW  
*Ricci et al, PRL (2023)*
  - measure couplings
  - measure Stark shifts
  - measure stability

$$E(\vec{r}) \propto e^{i(k_z z)} \cos(k_x x) \mathbf{e}_y$$

# Standing wave: Rabi couplings

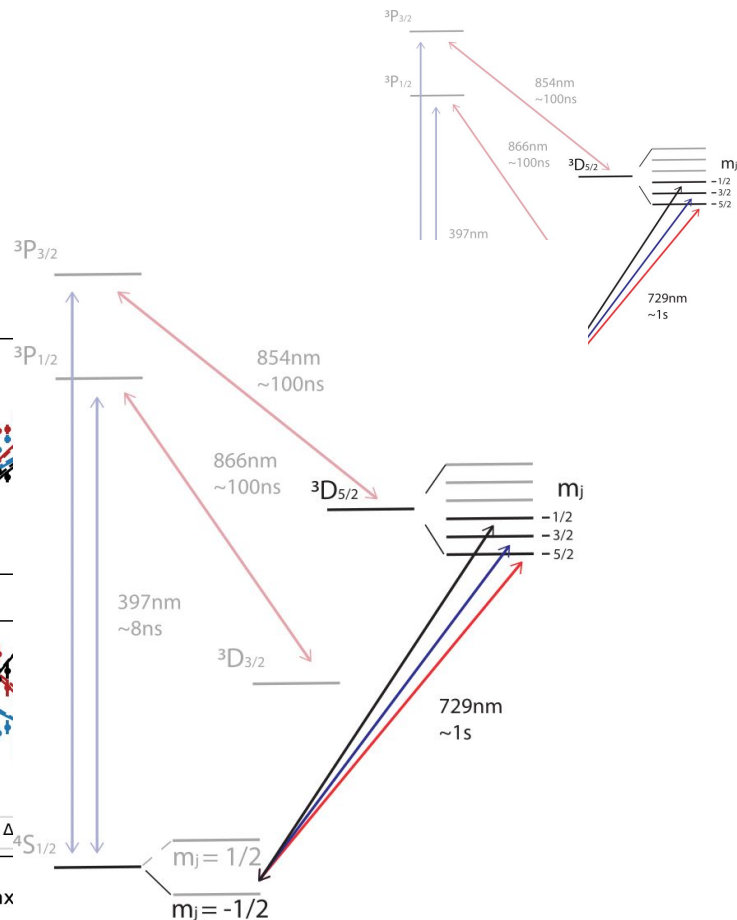

$$E(\vec{r}) \propto e^{i(k_z z)} \cos(k_x x) \mathbf{e}_y$$

$$\Omega_c \propto \langle g | \hat{r}_i \hat{r}_y | e \rangle \partial_i \mathbf{E}_y$$

# Standing wave: Rabi couplings + AC Stark shifts

# Standing wave: optical potentials

$$\omega (a^\dagger a + 1/2) + \Delta \sigma_z \cos^2(kx)$$

$$\sim \Delta \sigma_z x^2 \rightarrow \omega_c \sigma_z a^\dagger a$$

max/min ->  
state-dep. curvature

# Standing wave: optical potentials

$$\omega (a^\dagger a + 1/2) + \Delta \sigma_z \cos^2(kx)$$

$$\sim \Delta \sigma_z x^2 \rightarrow \omega_c \sigma_z a^\dagger a$$

max/min ->  
state-dep. curvature

$$\sim \Delta \sigma_z x \rightarrow F \sigma_z (a^\dagger + a)$$

slope ->  
state-dep. force

# Roadmap

- Single ion operations  
*Mehta et al. Nature Nanotech. 2016*
- Multi-wavelength integration  
*Niffenegger et al. Nature 2020*
- Multi-qubit operations  
*Mehta et al. Nature 2020*
- Engineered light: map of a standing wave  
*Ricci et al. PRL 2023*
- Engineered light: optical potentials
- Multi-zone trapping and transport
- Multi-zone operations
- Multi-(qubit, wavelength, zone) operations

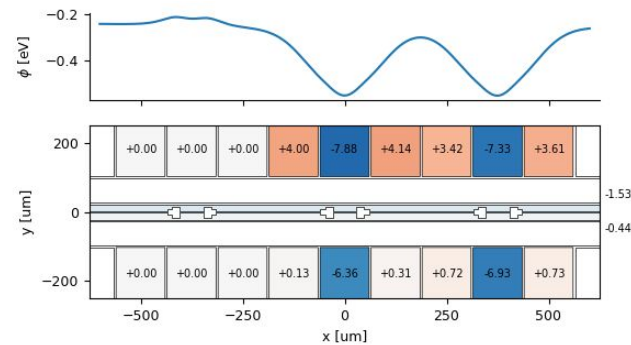

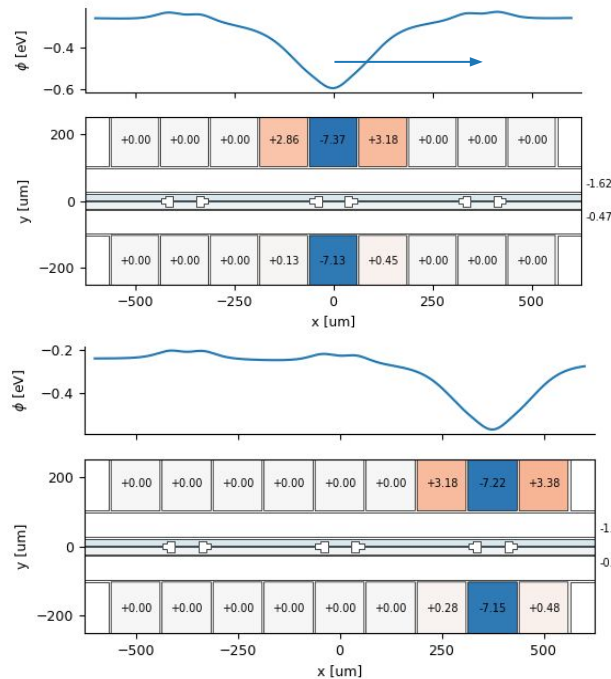

# Multizone operations: multiple trapping sites

shuttling between zones \*

ions in multiple zones

splitting/merging ion crystals

\* The optical couplers start to be bothering if you want to go fast!

# Multizone operations: loading from dedicated zone

- fully compatible with waveguide couplers
- faster loading of multiple ions
- no stray fields from PI:  
less drifts and calibrations

# Next-gen: engineered light beams

All wavelengths integrated:

Silicon nitride / alumina waveguides

Vortex beams  
(qubit, optical trapping)

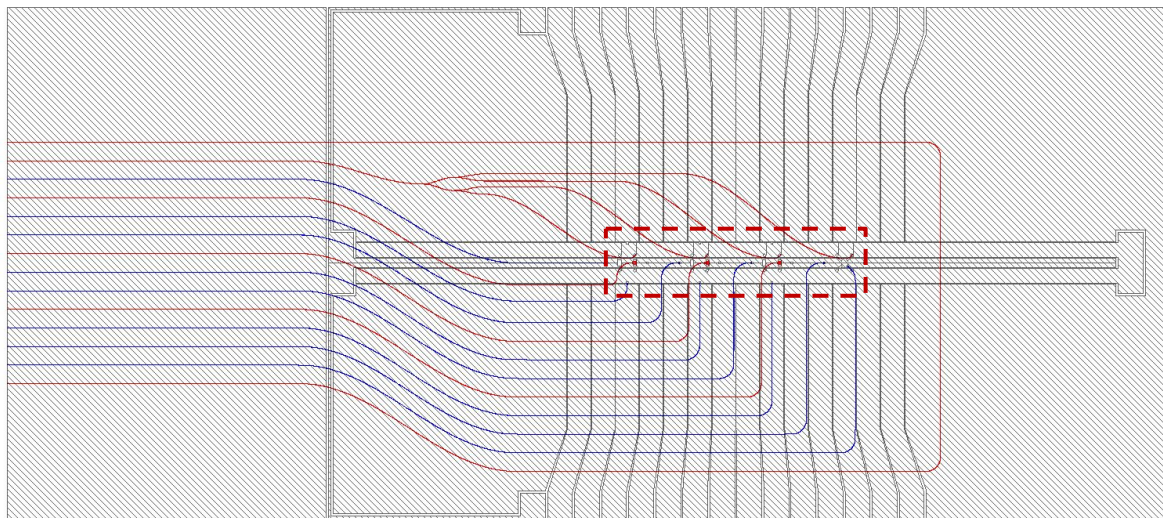

SW at 532 for light-shift gate

*Clark, PRL (2021)*

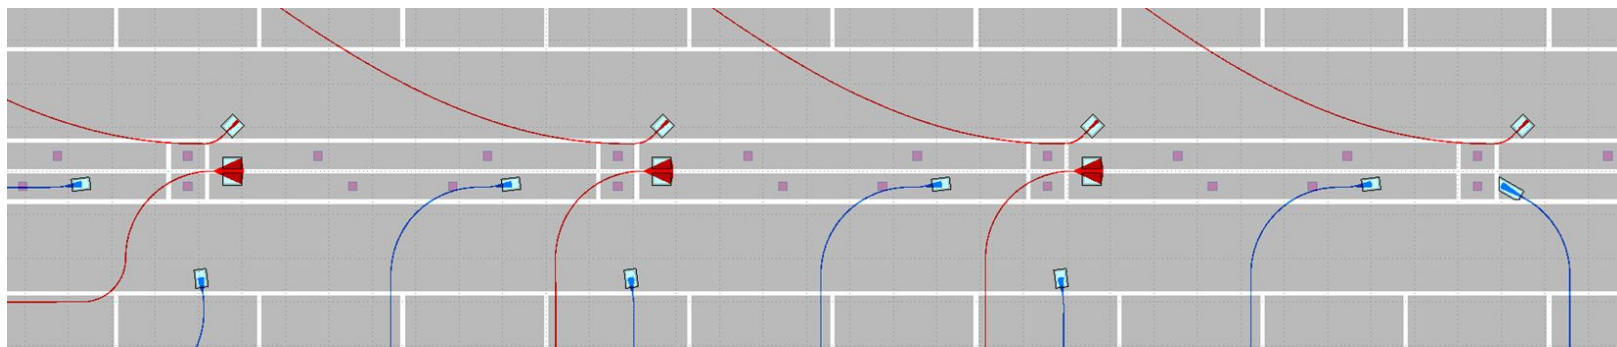

397 collection / cooling

# Next-gen: multizone fully integrated chip

- $\text{Si}_3\text{N}_4 / \text{Al}_2\text{O}_3$
- ITO coverings
- 1 loading + 3 gate zones
- full integration: cooling + gates

# Thank you

# Standing wave: drift and fluctuations

Here we have a pretty precise ruler!

- Drifts: repeatedly measure ion/SW relative position from the Rabi pattern
  - (long term) shift from PI light
- Noise: measure flop decay vs position explained by
  - noisy B field orientation
  - noisy ion position ( $\sigma_v = 50 \mu\text{V}$ )
