Tagger

High intensity (linearly polarized) tagged photon beam:

- $E_\gamma = E_0 - E_{e^-}$
- For $E_0 = 883$ MeV:
 - $E_\gamma = 40 - 800$ MeV
- For $E_0 = 1604$ MeV:
 - $E_\gamma = 70 - 1500$ MeV
- γ flux on target $\sim 3 \times 10^7 \gamma/s$

High intensity (linearly polarized) tagged photon beam:

- $E_\gamma = E_0 - E_{e^-}$
- For $E_0 = 883$ MeV:
 - $E_\gamma = 40 - 800$ MeV
- For $E_0 = 1604$ MeV:
 - $E_\gamma = 70 - 1500$ MeV
- γ flux on target $\sim 3 \times 10^7 \gamma/s$

Meson factory!

Tagger

Upgrade of the focal plane detector:

- Higher electron flux
- Higher efficiency
- Better control of systematic

Tagger

Upgrade of the focal plane detector:

- Higher electron flux
- Higher efficiency
- Better control of systematic

Crystal Ball

Highly segmented EM calorimeter

$$\Delta E/E = 0.020 \cdot E[\text{GeV}]^{0.36}$$

$$\sigma_\phi = \sigma_\theta / \sin \theta$$

$$\sigma_\theta = 2 - 3^\circ$$

Particle ID

Barrel of thin scintillators

$$\Delta\phi = 15^\circ$$

Multiwire Proportional Chambers

Precise charged tracking/positioning

$$\sigma_\theta \sim 2^\circ$$

$$\sigma_\phi \sim 3^\circ$$

TARGET

Liquid Hydrogen
10-cm capton cell

TAPS

Highly segmented EM calorimeter

$$\Delta E/E = 0.018 + 0.008/E[\text{GeV}]^{0.5}$$

$$\sigma_\phi = 14 \dots 0.95^\circ$$

$$\sigma_\theta < 1^\circ$$

TAPS-Veto

Thin scintillators before
each TAPS crystal

Hadronic Light-by-Light scattering:

$\bullet : \mathcal{A}(M \rightarrow \gamma^{(*)} \gamma^{(*)})$

→ Meson transition form factor

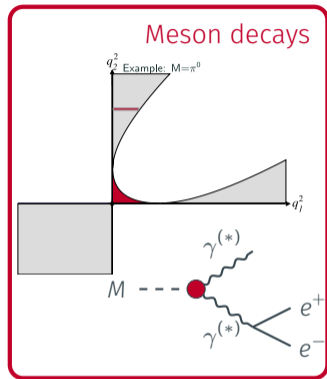

Accessing the TFF — Momentum transfer spectrum of the decay rate

$$\frac{d\Gamma(A \rightarrow Be^+e^-)}{dq^2\Gamma(A \rightarrow B\gamma)} = [\text{QED}] \left| \frac{\mathcal{F}_{AB}(q^2)}{\mathcal{F}_{AB}(0)} \right|^2 = [\text{QED}] |F_{AB}(q^2)|^2$$

Example $A = \pi^0$

$$\frac{d\Gamma(\pi^0 \rightarrow \gamma e^+e^-)}{dq^2\Gamma(\pi^0 \rightarrow \gamma\gamma)}$$

$$|F_{\pi^0}(q^2)|^2$$

Compare results — VMD-inspired parametrisation

$$F(q^2) = \frac{\Lambda_V^2}{\Lambda_V^2 - q^2 - i\Gamma_V\Lambda_V} \approx 1 + \Lambda^{-2}q^2 \quad q^2 < \Lambda_V^2$$

$\pi^0 \rightarrow e^+e^-\gamma$ - A2 existing measurement

A2 measurement (2008 and 2013):

A2 Collaboration, *Phys. Rev. C* 95, 025202 (2017)

- Two separate data sets with different running conditions
- 18 bins in $m_{e^+e^-} = [15 - 120]$ MeV
- 4.0×10^5 Dalitz decay events
- Uncertainties dominated by statistics

Significant improvement of direct time-like measurements

$\pi^0 \rightarrow e^+e^-\gamma$ - A2 ongoing measurement

First dedicated data taking in 2018:

- 6 weeks of beam
- Polarization peak placed in $\Delta(1232)$ region
- Higher rate thanks to upgraded system
- Experimental trigger tuned to the best conditions

Preliminary results:

First estimates:

- $\sim 2.2 \times 10^6$ signal events collected
- 6 times improvement compared to previous measurement!

World leading precision of time-like measurement!

A2 measurement (2007 and 2009):

A2 Collaboration, *Phys. Rev. C* 95, 035208 (2017)

- 34 bins in $m_{e^+e^-} = [30 - 490]$ MeV
- 5.4×10^4 Dalitz decay events
- Double statistics compared to previous A2 result

Good agreement between theory and experiment

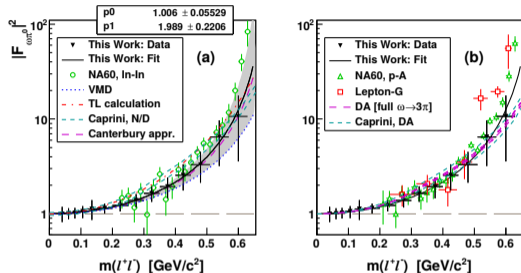

$\omega \rightarrow e^+ e^- \pi^0$ - A2 existing measurement

A2 measurement (2007 and 2009):

A2 Collaboration, *Phys. Rev. C* 95, 035208 (2017)

- 14 bins in $m_{e^+e^-} = [30 - 630]$ MeV
- 1.1×10^3 Dalitz decay events
- Total uncertainties dominated by the fit

Lower than previous measurements, but still in agreement due to the bigger uncertainties

Plot: L. Heijkenskjöld

First dedicated data taking in 2019:

- 6 weeks of beam
- $E_{e^-} = 1604$ MeV
- Unpolarized photon beam with 10-cm LH₂ target

3 times more ω Dalitz decays produced!

After some preparatory studies, collection of an even larger data sample is planned:
Total improvement of ~ 9 times compared to previous measurement

Provide experimental input to understand the discrepancy between $\mu^+\mu^-\pi^0$ and $e^+e^-\pi^0$ extractions

High Precision
Precision tests

Rare processes/small effects

Cosmological

Rare decay - $\eta \rightarrow \pi^0 \gamma \gamma$

Excellent χ PT probe:

- $\mathcal{O}(p^2)$ and $\mathcal{O}(p^4)$ tree level terms vanish
- π and K loops at $\mathcal{O}(p^4)$ are heavily suppressed
- Major contribution to $d\Gamma(\eta \rightarrow \pi^0 \gamma \gamma)$ comes from $\mathcal{O}(p^6)$ counter terms

Searches for possible new physics:

- Exclusion limit for Leptophobic $U(1)_B$ -boson

$$\eta \rightarrow B\gamma \rightarrow \pi^0 \gamma \gamma$$

R. Escribano, S. González-Solís, R. Jora and E. Royo, Phys. Rev. D 102, 034026 (2020)

Taken from: P. Gauzzi [KLOE-2], PoS ICHEP2022, 791 (2022)

$d\Gamma(\eta \rightarrow \pi^0 \gamma \gamma)/dM^2(\gamma \gamma)$ comparison

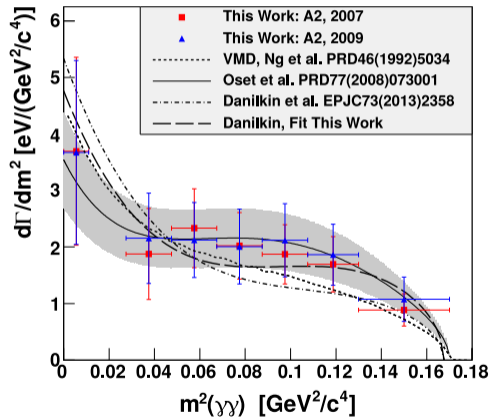

The experimental situation needs to be clarified (JEF, REDTOP, A2@MAMI)

A2 measurement (2007 and 2009):

A2 Collaboration, *Phys. Rev. C* **90**, 025206 (2014)

- 6.0×10^7 η mesons produced
- 1.2×10^3 $\eta \rightarrow \pi^0 \gamma \gamma$ measured
- ✓ Most precise (at the moment)
 $d\Gamma(\eta \rightarrow \pi^0 \gamma \gamma)/dm^2(\gamma \gamma)$ measurement
- ✗ Combination of two data sets with different running conditions
- ✗ Trigger not fully optimized for this reaction channel

Dedicated data taking in 2019:

- 6 weeks of beam
- $E_{e^-} = 1604$ MeV
- Unpolarized photon beam with 10-cm LH₂ target

Improvements:

- ✓ Upgraded A2 system: two times higher photon flux, faster DAQ
- ✓ Same conditions in both beamtimes

3 times more η produced!

World-leading $d\Gamma(\eta \rightarrow \pi^0 \gamma \gamma)/dm^2(\gamma \gamma)$ and $d\Gamma(\eta \rightarrow \pi^0 \gamma \gamma)/dm^2(\pi^0 \gamma)$ measurements

A2 measurement (2007 and 2009):

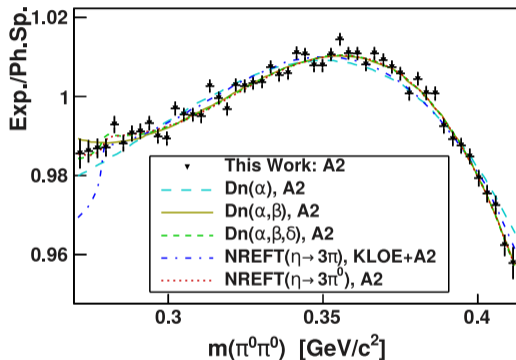

A2 Collaboration, *Phys. Rev. C* **97**, 065203 (2018)

- 7.0×10^7 η events measured
- Most precise study of dynamics
 - parametrization of Dalitz plot density
 - Cusp from $\pi^+ \pi^- - \pi^0 \pi^0$

Searches for possible new physics:

- Exclusion limit for up/hadrophilic scalar S -boson

$$\eta \rightarrow \pi^0 S \rightarrow \pi^0 \pi \pi$$

A2 measurement (2007 and 2009):

A2 Collaboration, *Phys. Rev. D* **98**, 012001 (2018)

- 1.2×10^5 η' events measured
- Most precise study of dynamics
 - parametrization of Dalitz plot density
 - Cusp from $\pi^+ \pi^- - \pi^0 \pi^0$

Searches for possible new physics:

- Exclusion limit for up/hadrophilic scalar S-boson

$$\eta' \rightarrow \eta S \rightarrow \eta \pi \pi$$

Meson decays

Compton scattering

Baryon spectroscopy

Di-baryon spectroscopy

Meson decays

Time-like Transition form factors:

- $\pi^0 \rightarrow e^+e^-\gamma$
 - high quality data set collected and calibrated
 - analysis on going to extract TFF
- $\omega \rightarrow e^+e^-\pi^0$
 - 6 weeks of new data calibrated
 - much more data to come

Meson decays

Time-like Transition form factors:

- $\pi^0 \rightarrow e^+e^-\gamma$
 - high quality data set collected and calibrated
 - analysis on going to extract TFF
- $\omega \rightarrow e^+e^-\pi^0$
 - 6 weeks of new data calibrated
 - much more data to come

Rare decays and small effects:

- $\eta \rightarrow \pi^0\gamma\gamma$:
 - new high quality data set collected and calibrated
 - analysis on going to extract $\pi^0\gamma$ and $\gamma\gamma$ distributions
 - results can provide new inputs for understanding experimental situation
- Published results on:
 - $\eta \rightarrow \pi^0\pi^0\pi^0$
 - $\eta' \rightarrow \eta\pi^0\pi^0$

Meson decays

Time-like Transition form factors:
