

Nuclear EOS for general proton fractions and temperature based on chiral EFT

Kai Hebeler

Trento, September 12, 2023

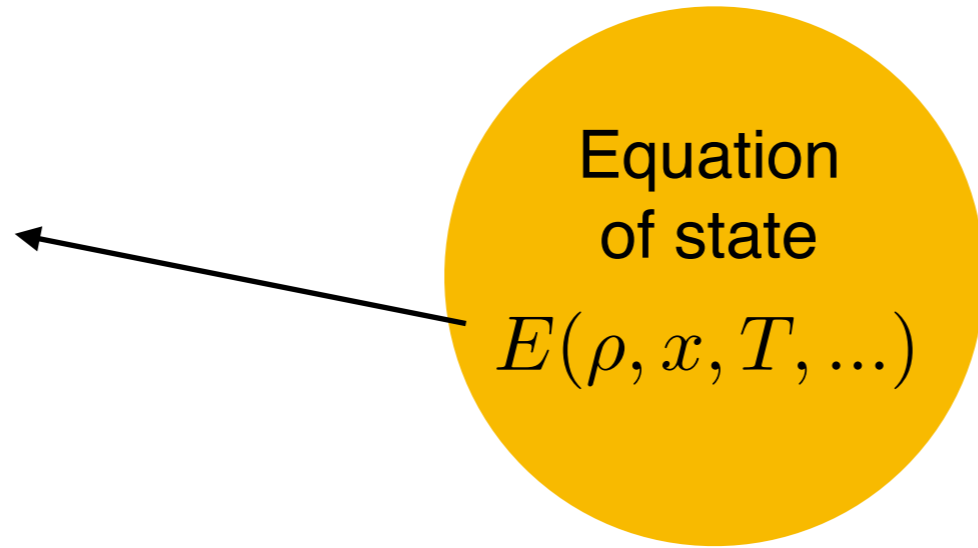

MICRA2023:

Microphysics in computational relativistic astrophysics

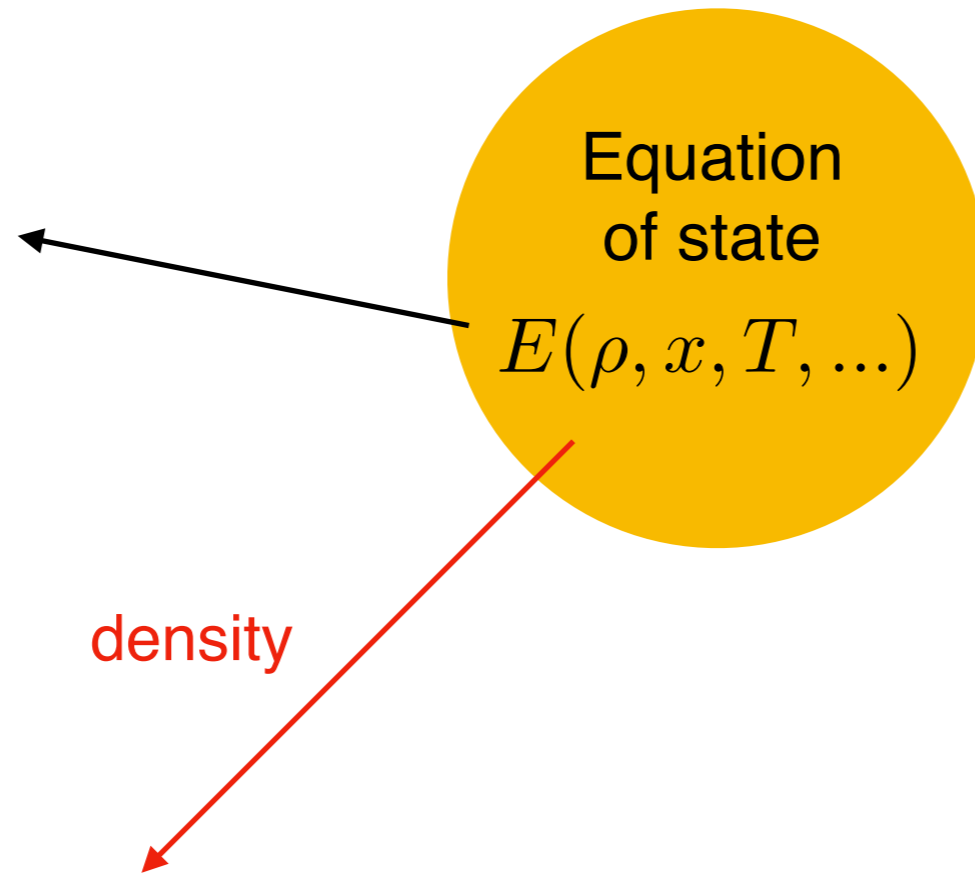

The goal

Related
thermodynamic
observables:
pressure, free
energy,
speed of sound,
chemical
potentials,
...

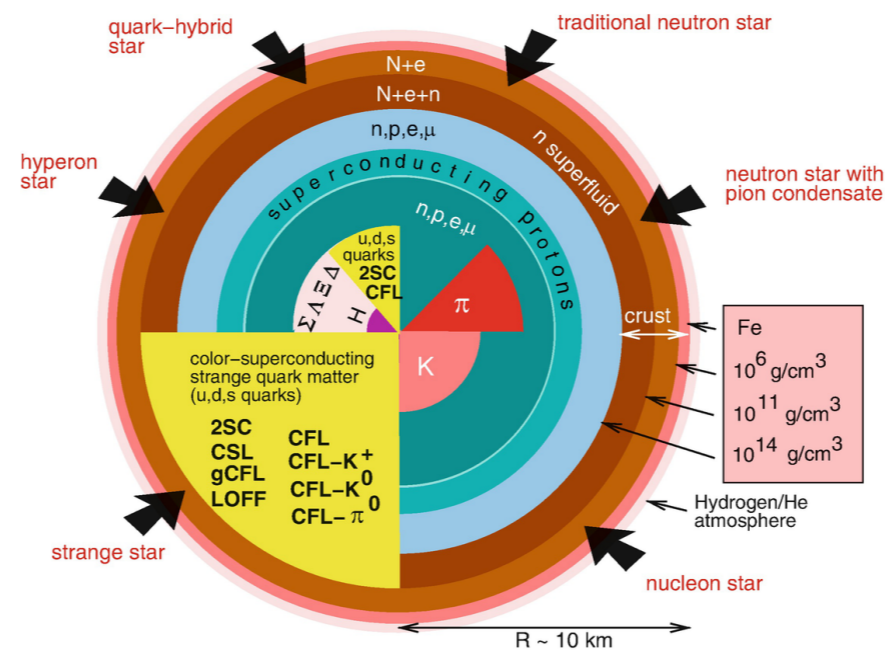

The goal

Related thermodynamic observables:
pressure, free energy,
speed of sound,
chemical potentials,
...

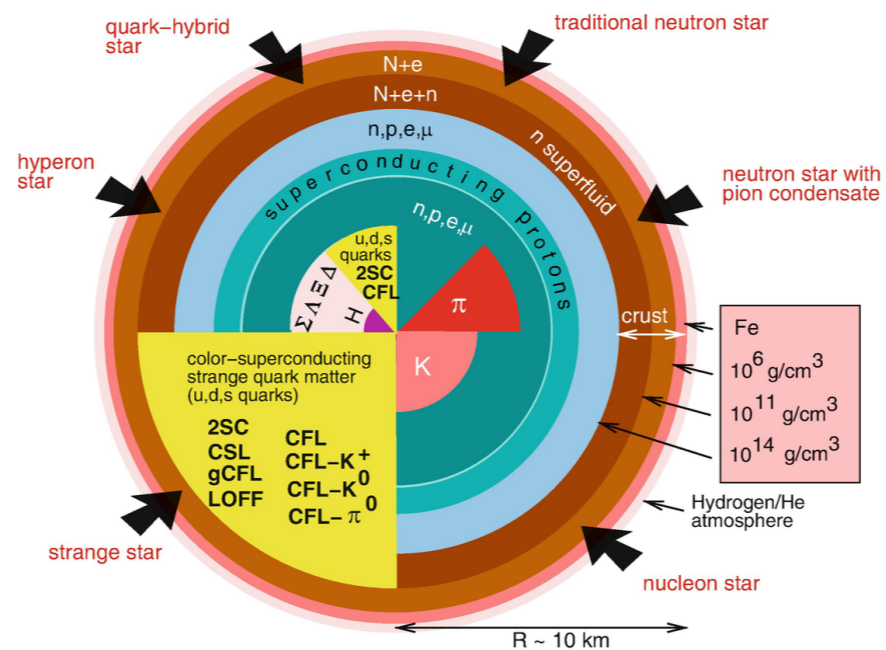

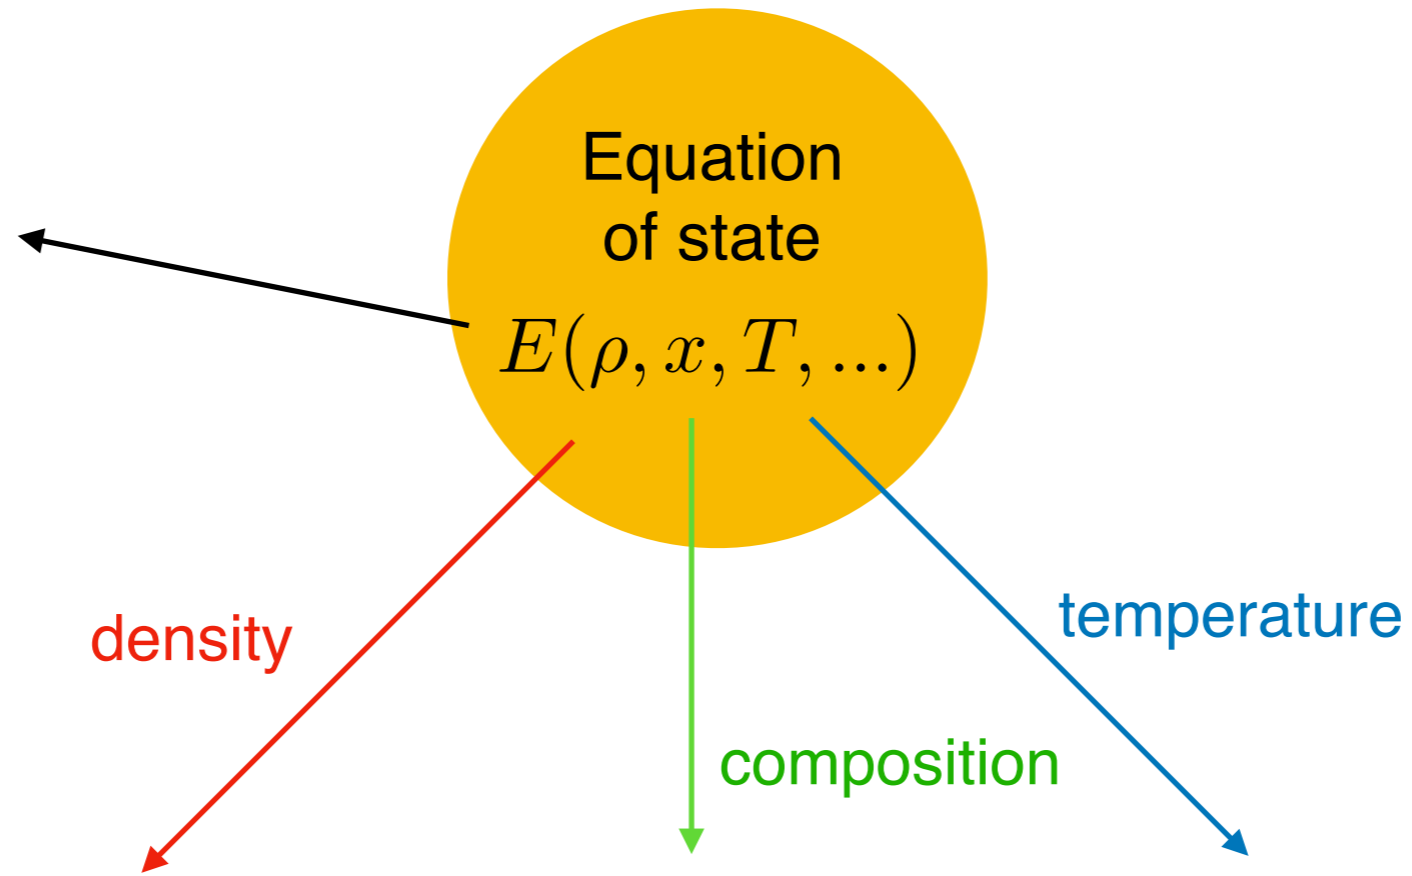

The goal

Related thermodynamic observables:
 pressure, free energy,
 speed of sound,
 chemical potentials,
 ...

The goal

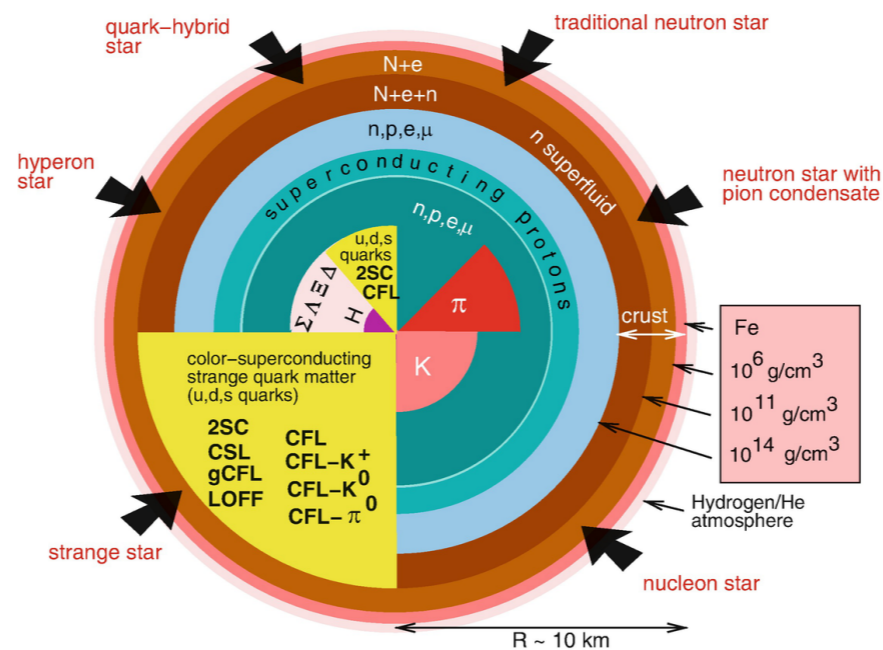

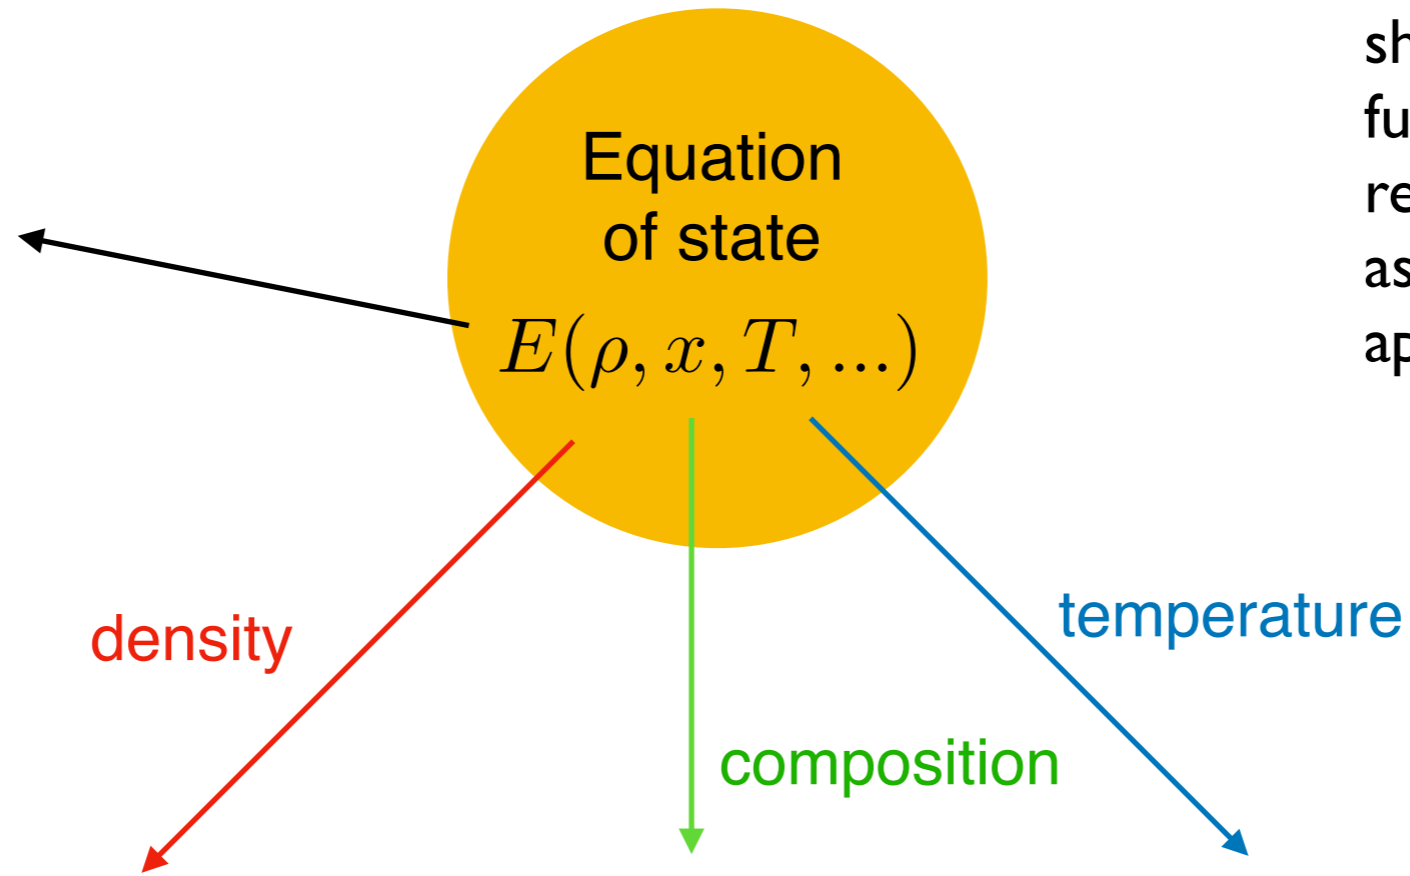

Related thermodynamic observables: pressure, free energy, speed of sound, chemical potentials, ...

The goal

Related thermodynamic observables: pressure, free energy, speed of sound, chemical potentials, ...

Parameter space should ideally cover full range of values relevant for astrophysical applications

The equation of state of high-density matter: Microscopic approaches

perturbative QCD

The equation of state of high-density matter: Microscopic approaches

- Calculations based on chiral effective field theory interactions
main focus of this talk

The equation of state of high-density matter: Microscopic approaches

- Calculations based on chiral effective field theory interactions
main focus of this talk
- **Functional Renormalization Group based on QCD**

Ab initio nuclear theory

**nuclear structure and
reaction observables**

Quantum Chromodynamics

Ab initio nuclear theory

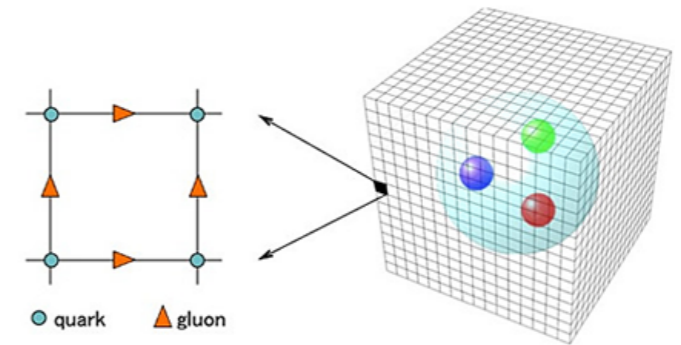

**nuclear structure and
reaction observables**

perturbative QCD

- limited to very high energies/densities

Lattice QCD

- requires extreme amounts of computational resources
- currently limited to 1- or 2-nucleon systems
- current accuracy insufficient for precision nuclear structure

Quantum Chromodynamics

Ab initio nuclear theory

**nuclear structure and
reaction observables**

Chiral effective field theory
nuclear interactions and currents

Quantum Chromodynamics

Ab initio nuclear theory

**nuclear structure and
reaction observables**

ab initio many-body frameworks

Faddeev, Quantum Monte Carlo, no-core shell model, coupled cluster ...

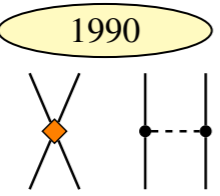

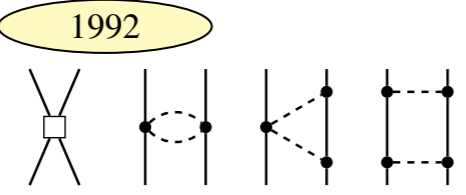

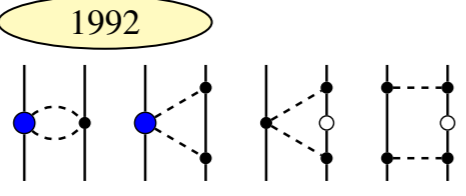

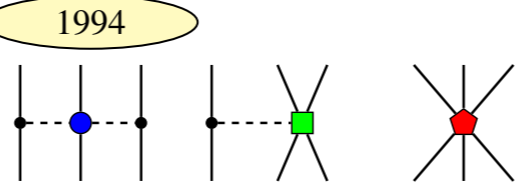

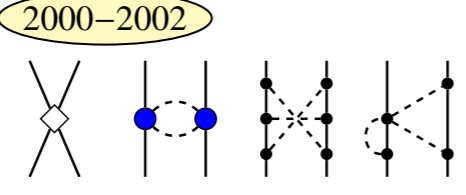

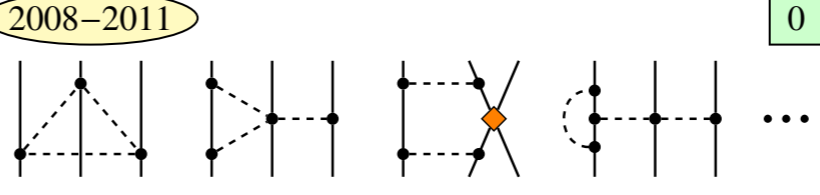

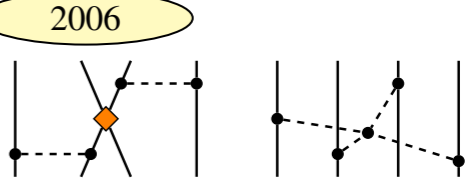

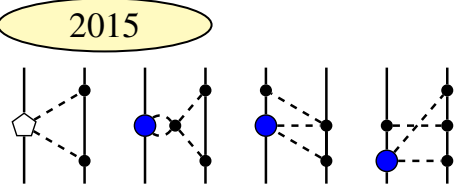

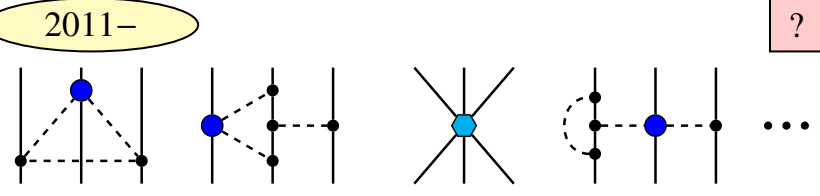

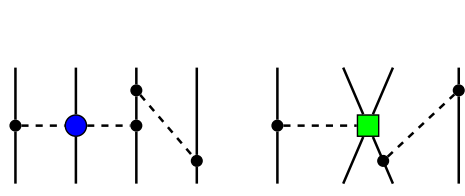

Chiral effective field theory

nuclear interactions and currents

Quantum Chromodynamics

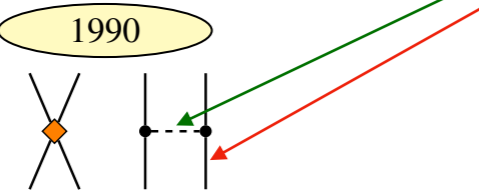

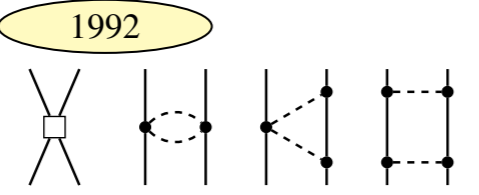

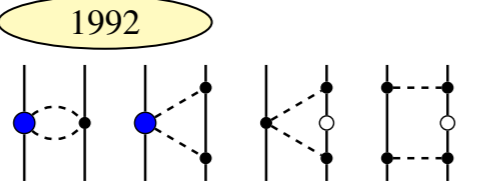

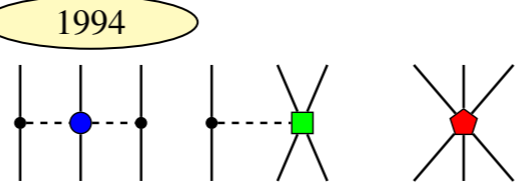

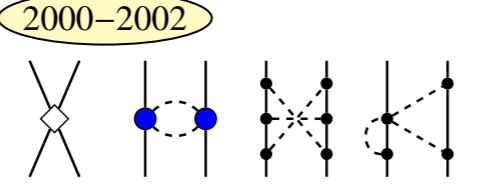

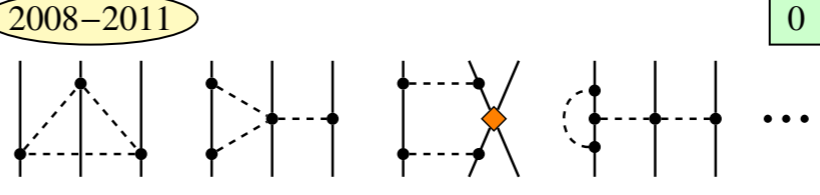

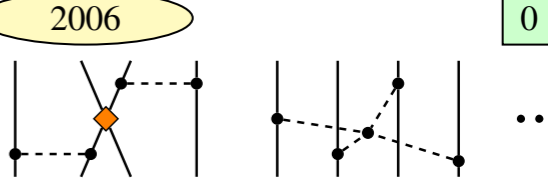

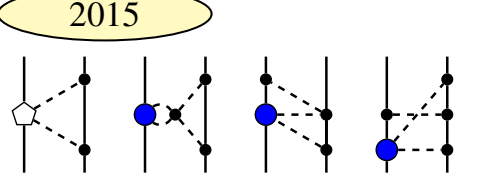

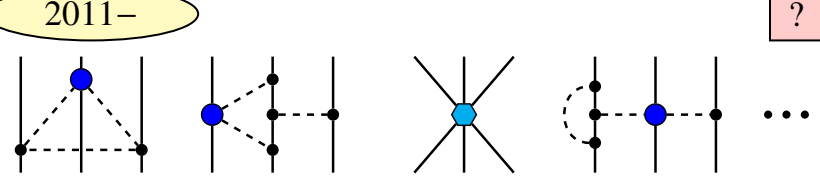

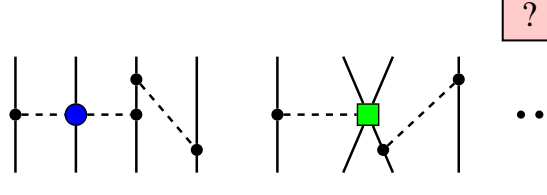

Chiral effective field theory for nuclear forces

3N forces appear naturally

Development of nuclear interactions

Equation of state: Many-body perturbation theory

central quantity of interest: energy per particle E/N

$$H(\lambda) = T + V_{\text{NN}}(\lambda) + V_{\text{3N}}(\lambda) + \dots$$

- “hard” interactions require non-perturbative summation of diagrams
- with low-momentum interactions much more perturbative
- inclusion of contributions from 3N interaction crucial and challenging!

Equation of state of neutron matter up to nuclear densities

- EOS of neutron matter well constrained by chiral EFT up to nuclear densities
- results insensitive to choices of nuclear forces and many-body methods

Equation of state of symmetric nuclear matter: nuclear saturation

Batty et. al,
Karlsruhe (1987)

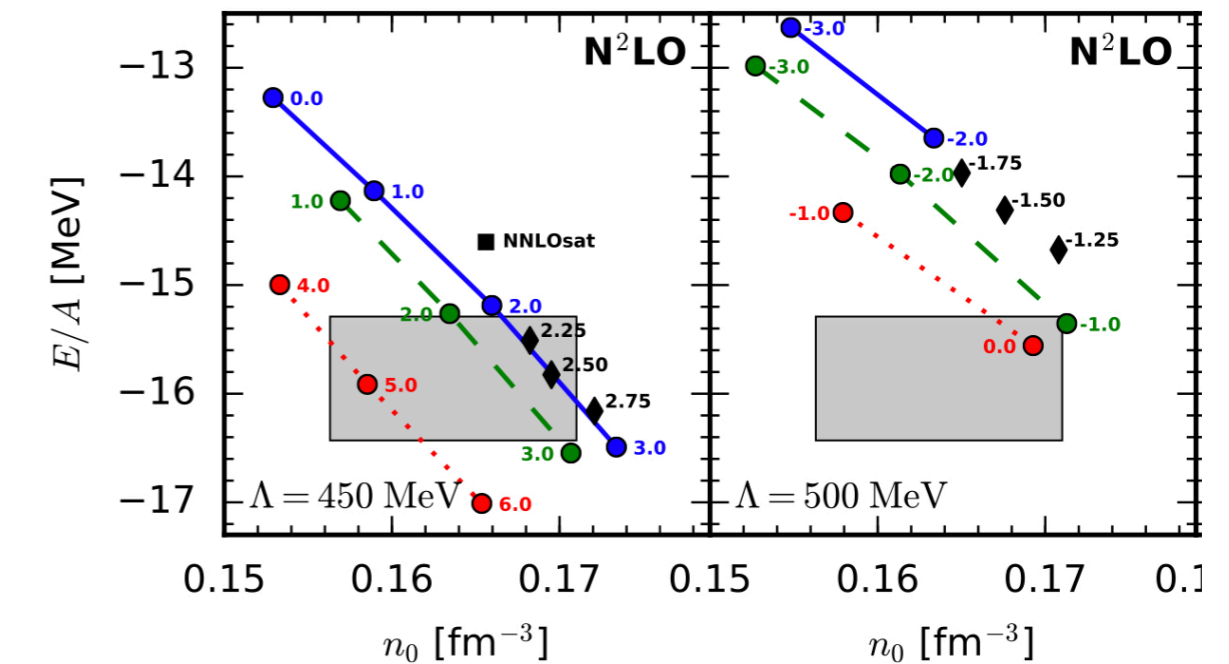

contributions from 3NF crucial for
realistic description of nuclear matter

KH, Bogner, Furnstahl, Nogga,
PRC(R) 83, 031301 (2011)

Results for symmetric and neutron matter at T=0

- performed MBPT calculations up to 4th order (complete for NN interactions)
- fits to the empirical saturation point possible
- natural convergence pattern in MBPT and chiral expansion

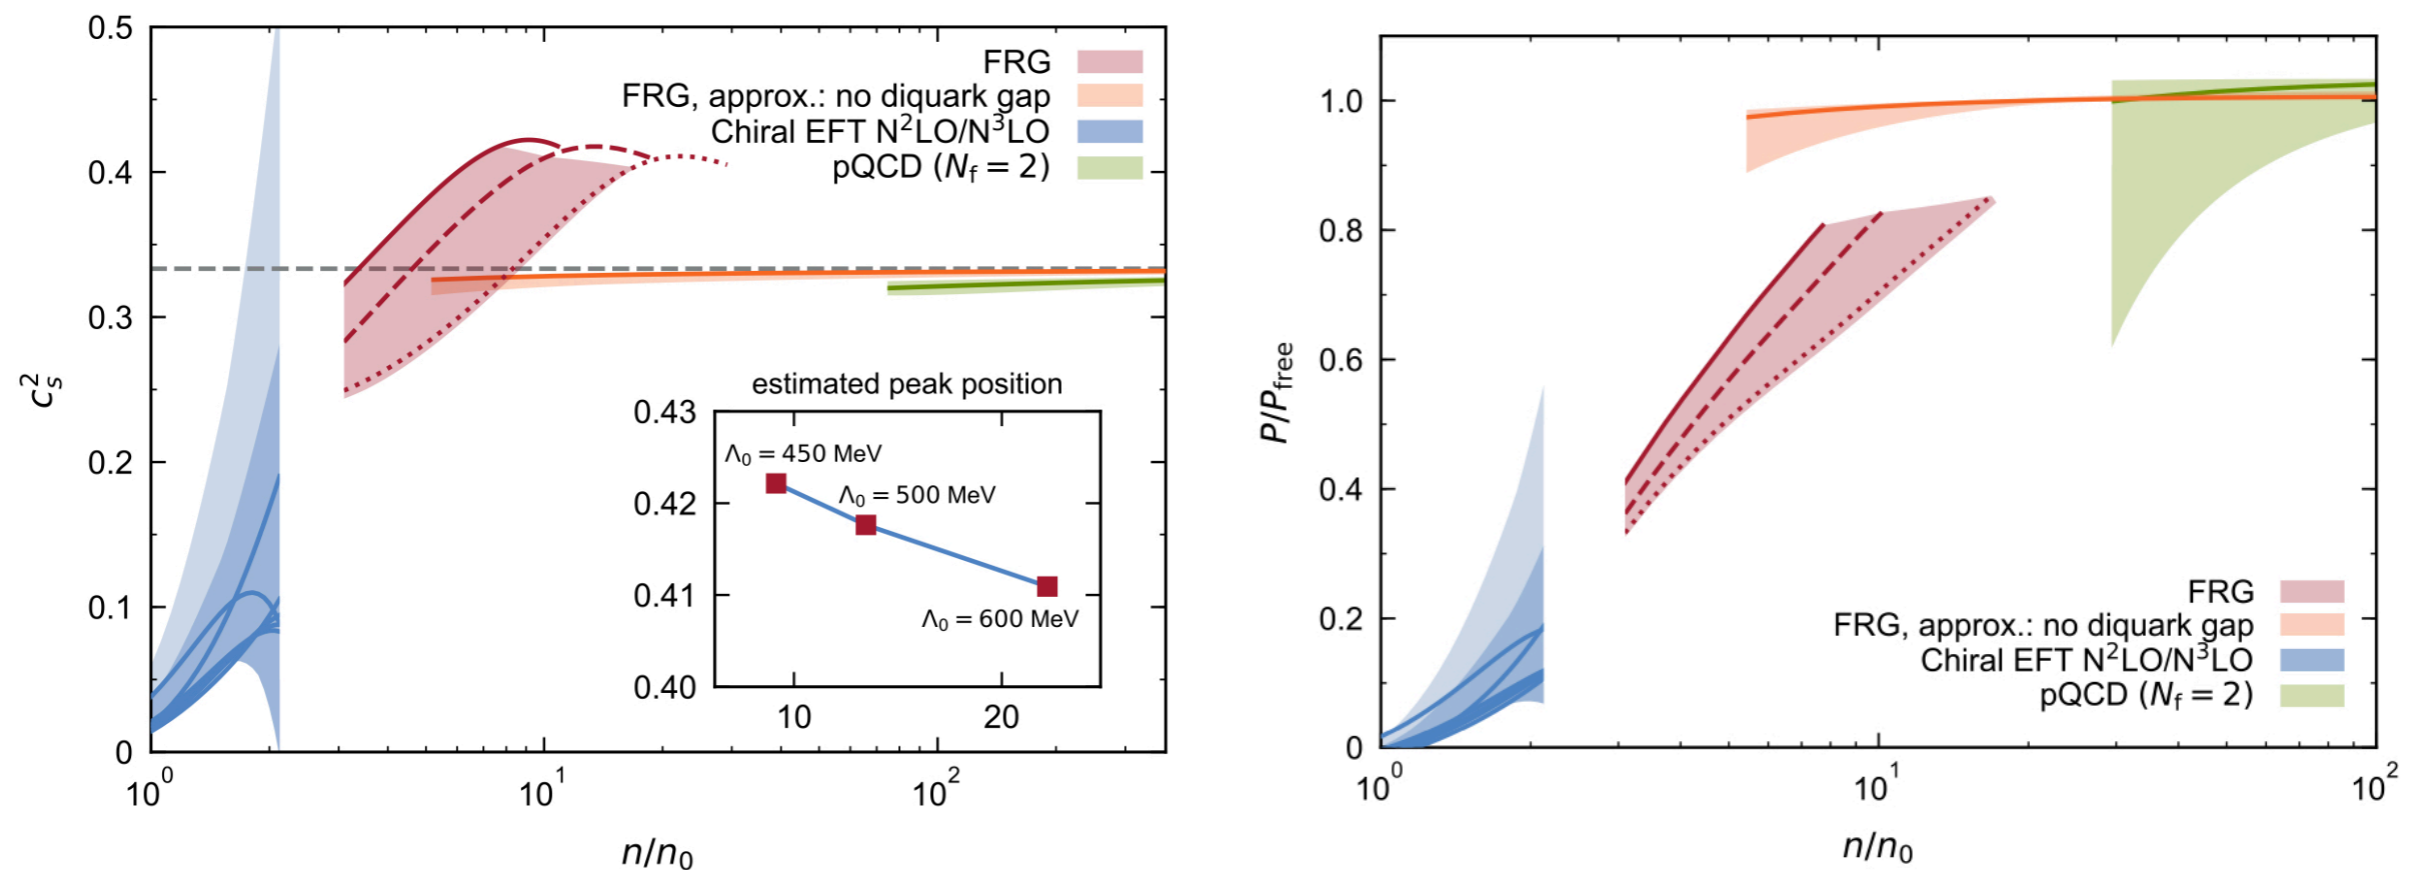

Drischler, KH, Schwenk, PRL 122 (2019)

Results for symmetric matter at $T=0$

- performed MBPT calculations up to 4th order (complete for NN interactions)
- fits to the empirical saturation point possible
- natural convergence pattern in MBPT and chiral expansion

-
- comparison with Functional Renormalization Group (fRG) calculations based on QCD and perturbative QCD

EOS at high density and neutron star radius constraints

KH, Lattimer, Pethick, Schwenk, ApJ 773, 11 (2013)

parametrize our ignorance via piecewise high-density extensions of EOS:

- use polytropic ansatz $p \sim \rho^\Gamma$ (results insensitive to particular form)
- range of parameters $\Gamma_1, \rho_{12}, \Gamma_2, \rho_{23}, \Gamma_3$ limited by physics

Incorporate constraints from chiral EFT, causality and neutron star masses

EOS at high density and neutron star radius constraints

use the constraints:

recent NS observations

$$M_{\text{max}} > 1.97 M_{\odot}$$

causality

$$v_s(\rho) = \sqrt{dP/d\varepsilon} < c$$

KH, Lattimer, Pethick, Schwenk, ApJ 773,11 (2013)

constraints lead to significant reduction of EOS uncertainty band

EOS at high density and neutron star radius constraints

use the constraints:

fictitious NS mass

$$M_{\max} > 2.4 M_{\odot}$$

causality

$$v_s(\rho) = \sqrt{dP/d\varepsilon} < c$$

KH, Lattimer, Pethick, Schwenk, ApJ 773, 11 (2013)

increased M_{\max} systematically reduces width of band

EOS at high density and neutron star radius constraints

KH, Lattimer, Pethick, Schwenk, ApJ 773, 11 (2013)

see also KH, Lattimer, Pethick, Schwenk, PRL 105, 161102 (2010)

- low-density part of EOS sets scale for allowed high-density extensions
- current radius prediction for typical $1.4 M_{\odot}$ neutron star: 9.7 – 13.9 km

Incorporating constraints from pQCD

Kurkela et al., ApJ 789, 127 (2014)

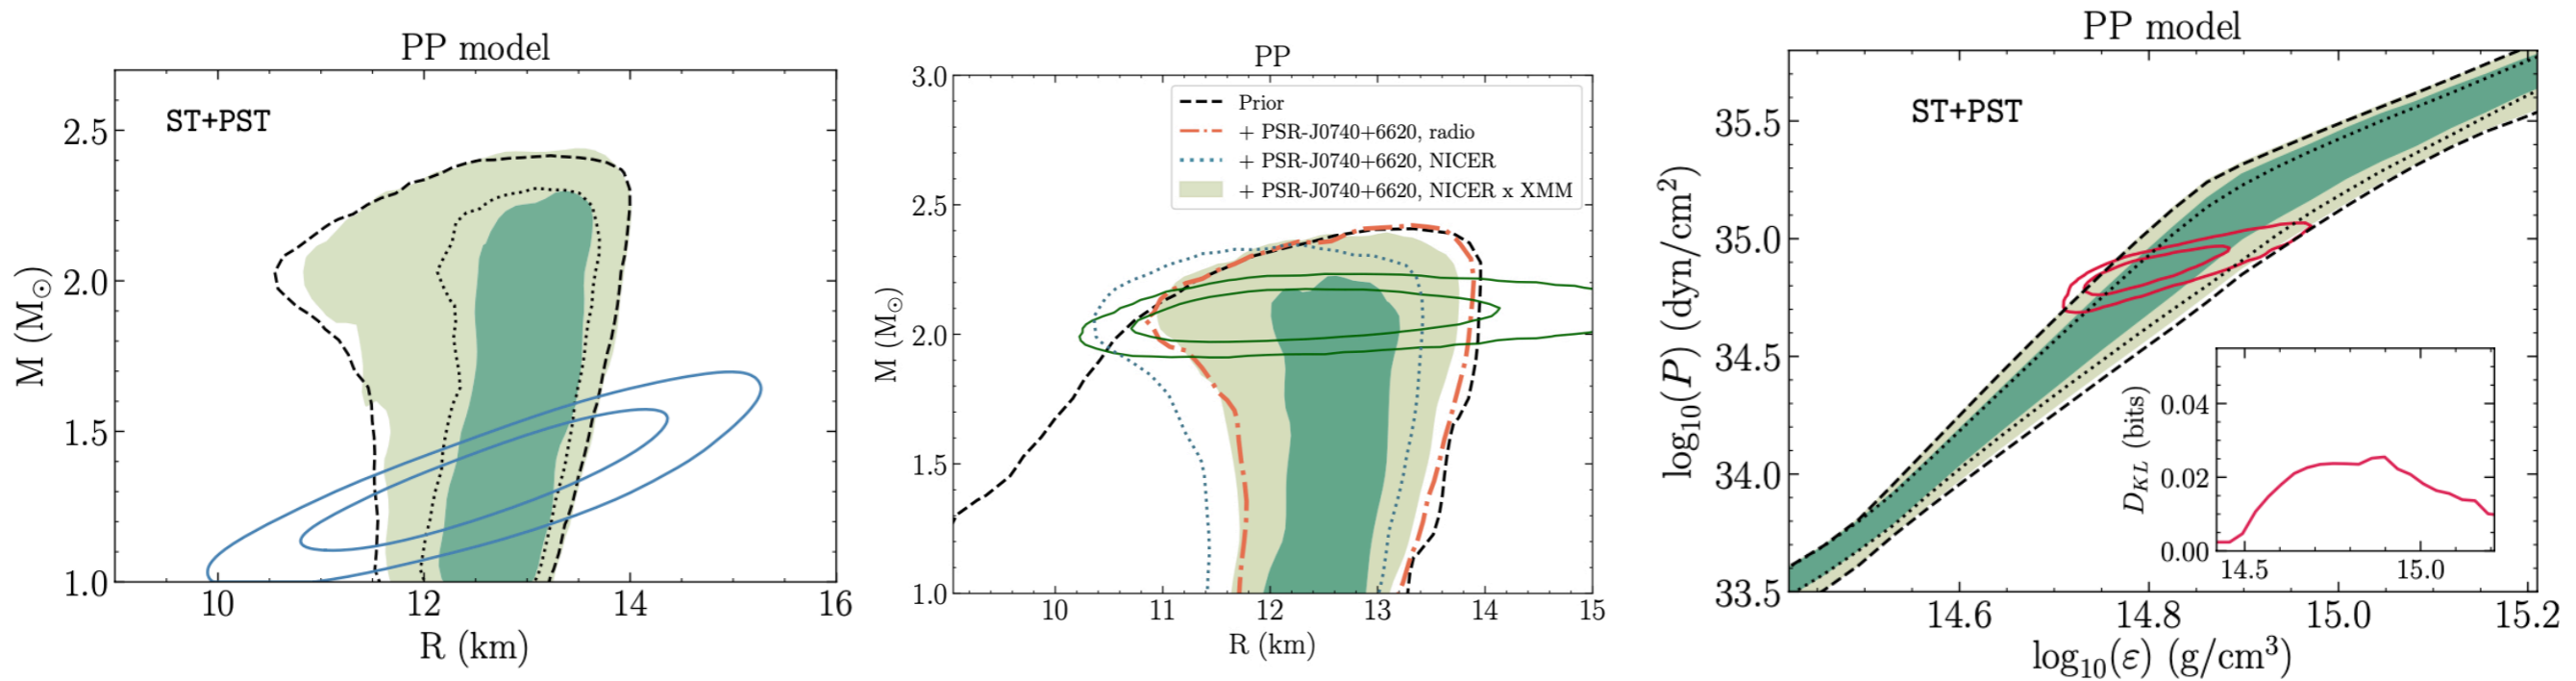

The use of thermodynamic integral constraints allows to lower the gap between NS densities and density regime of pQCD.

Komoltsev et al., PRL 128, 20 (2022)

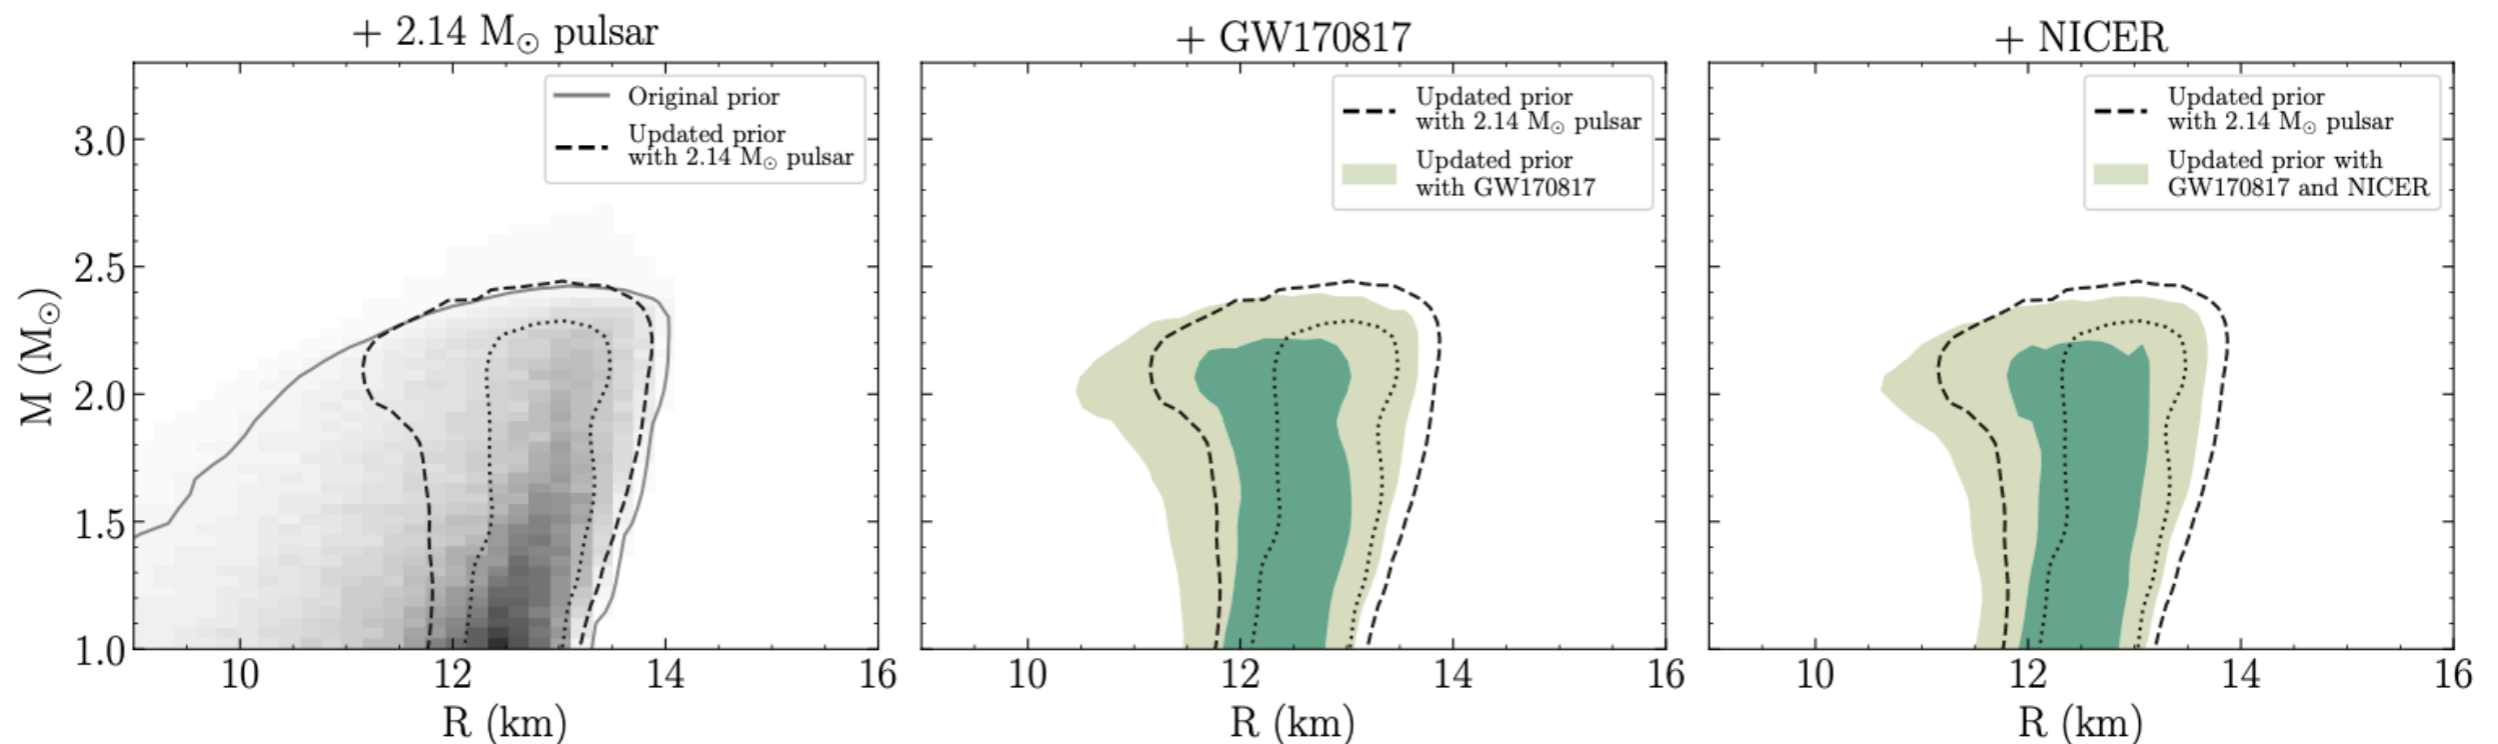

Constraints on neutron star radii

constraints on EOS and NS radii from first NICER observations:

Raaijmakers et al., APJL 887, 22 (2019); Raaijmakers et al., APJL 918, 2 (2021)

additionally incorporating constraints from LIGO and mass measurements:

Constraints on neutron star radii

constraints on EOS and NS radii from first NICER observations:

Raaijmakers et al., APJL 887, 22 (2019); Raaijmakers et al., APJL 918, 2 (2021)

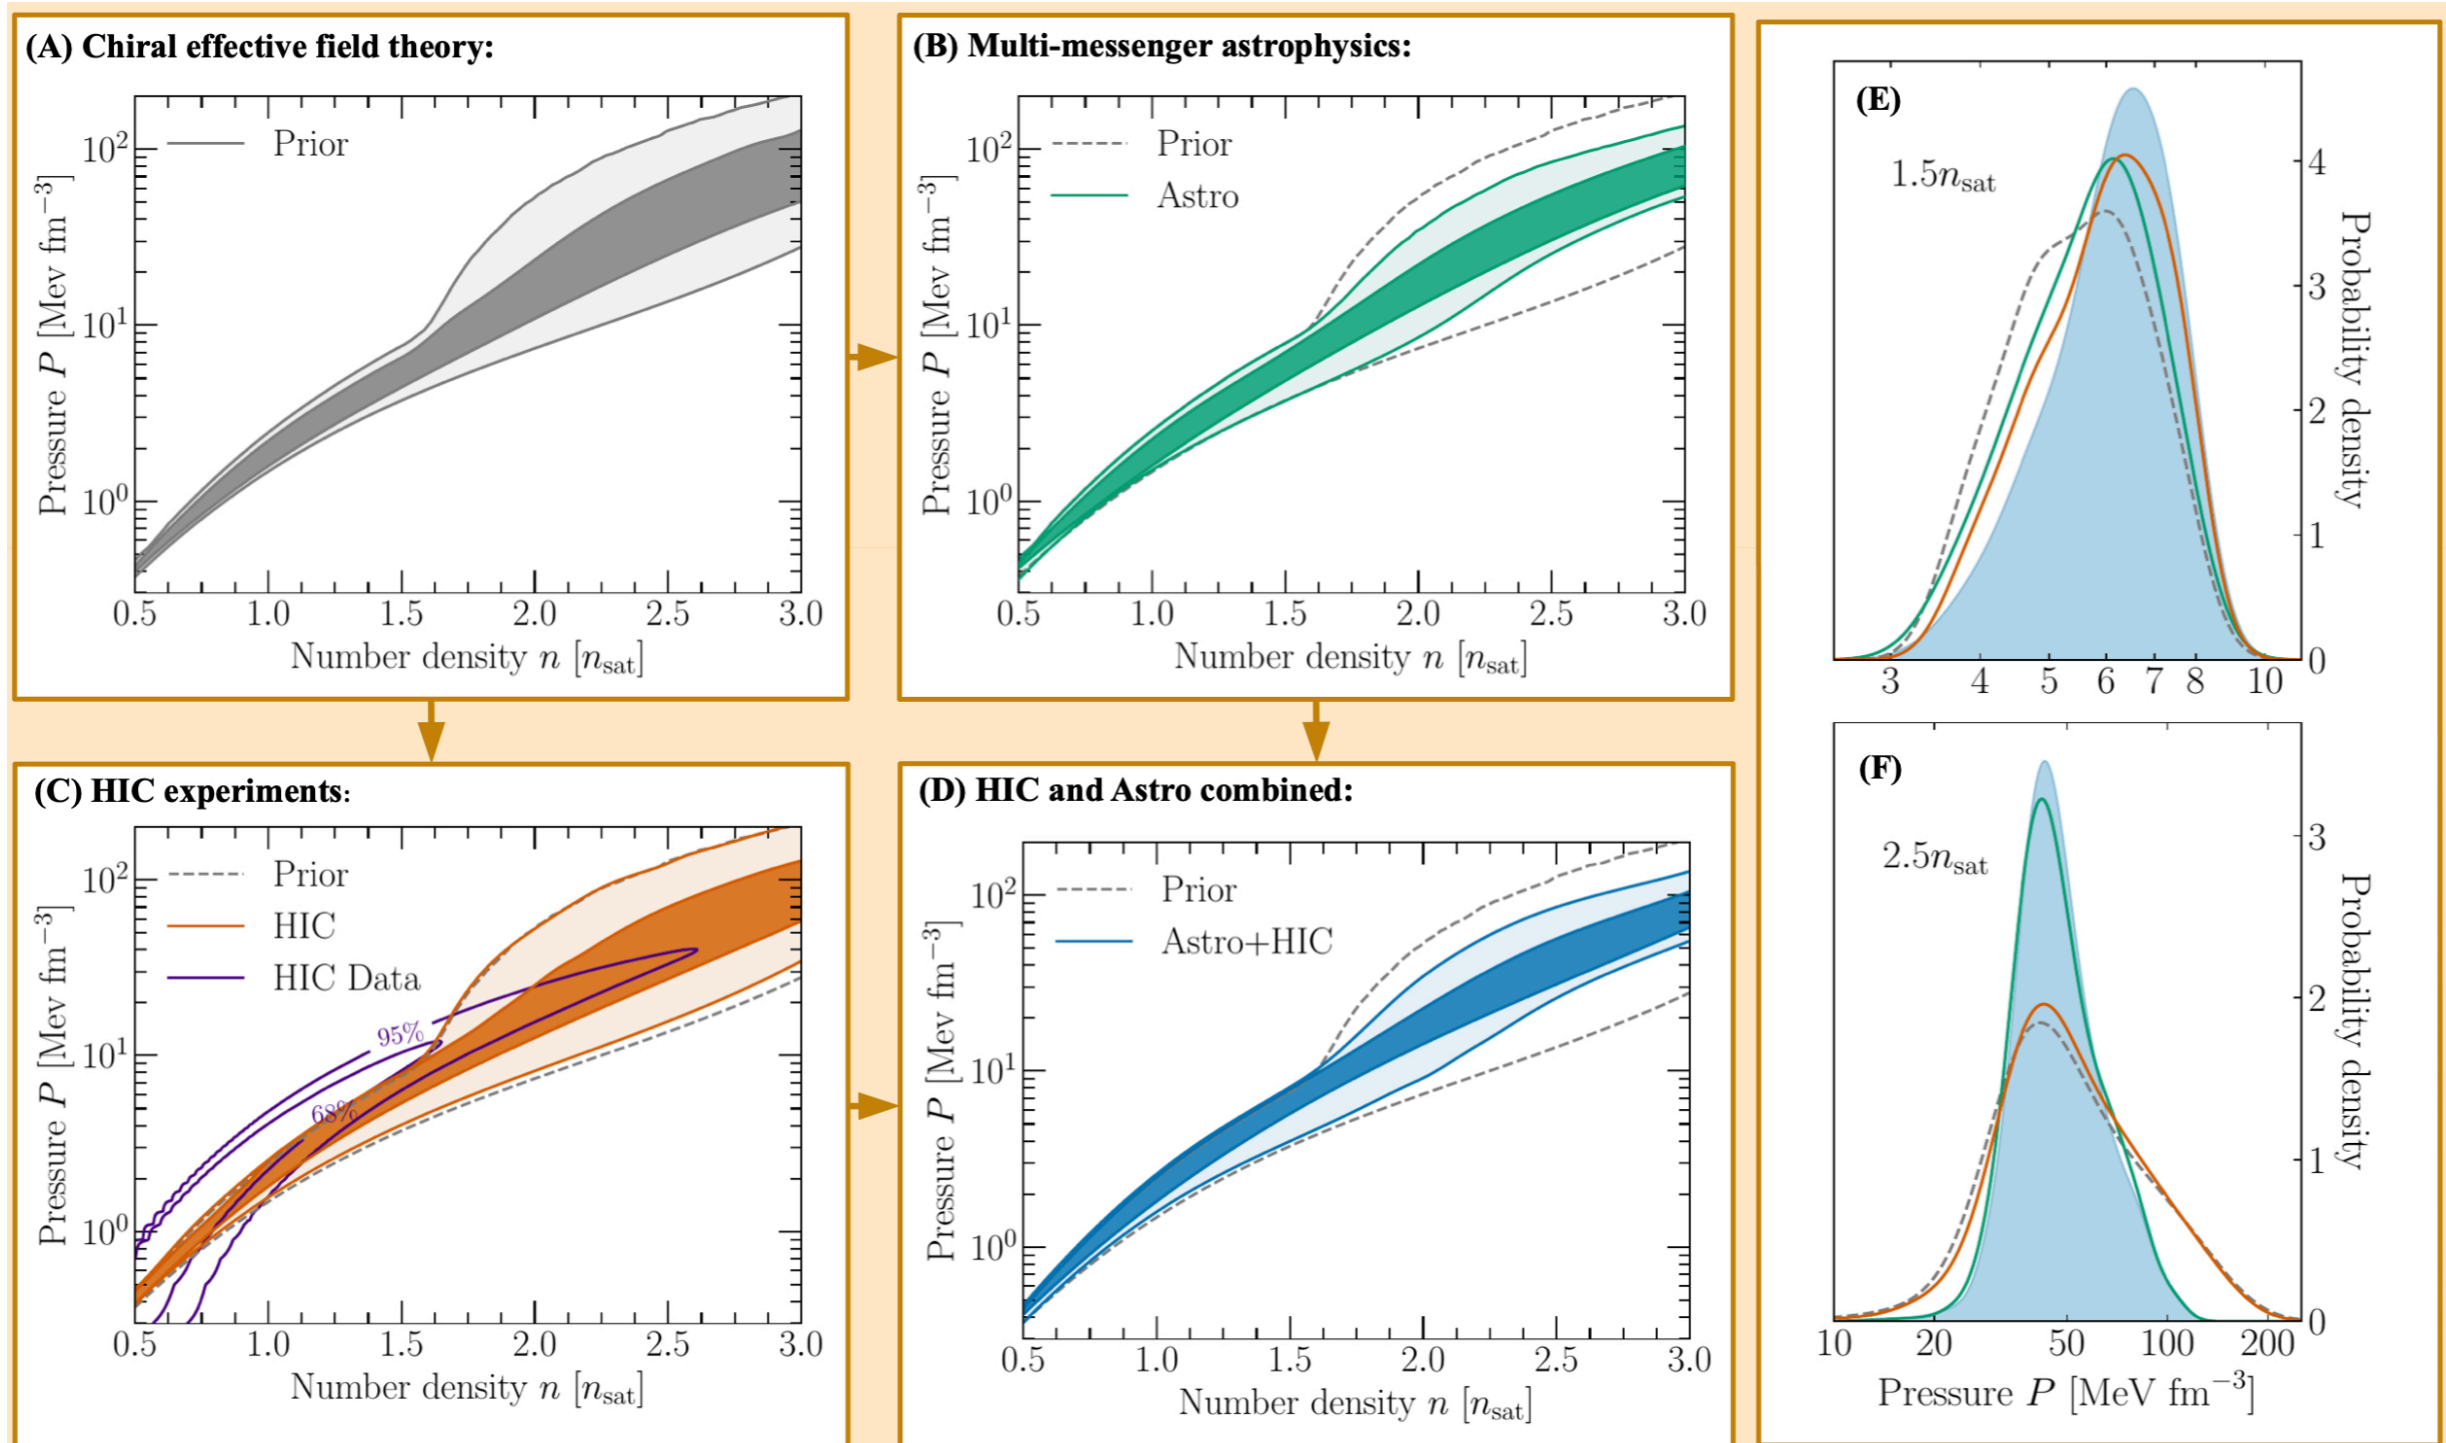

additionally incorporating constraints from LIGO and mass measurements:

NICER/LIGO observation do not yet provide significant additional constraints of EOS at supranuclear densities.

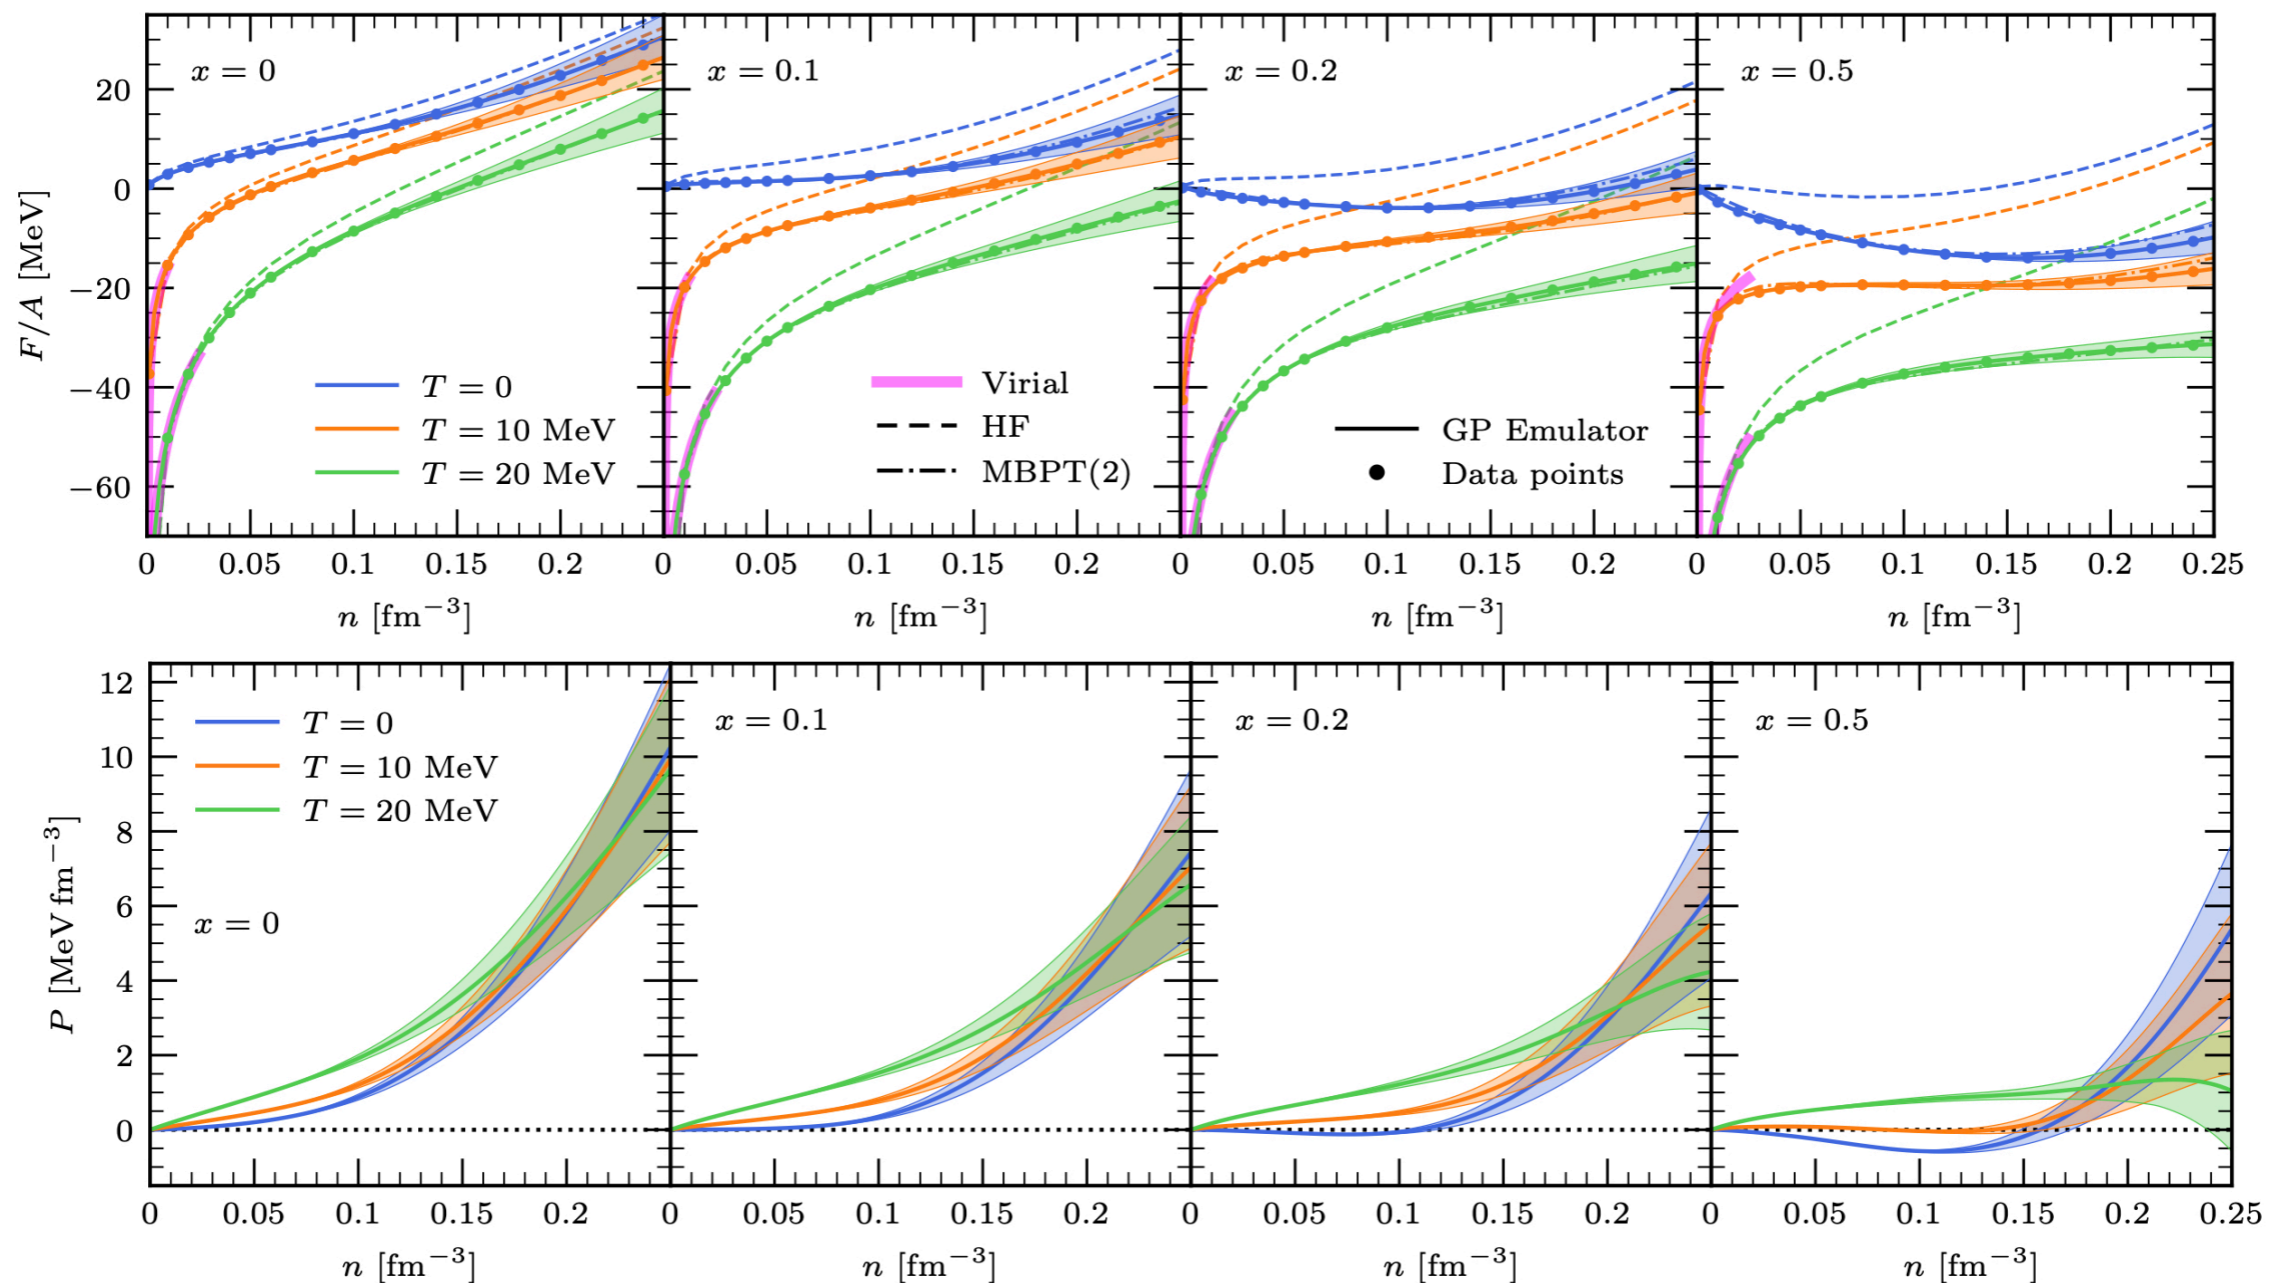

Constraints from multimessenger astrophysics and heavy ion experiments

Huth et al., Nature 606, 276 (2022)

Current HIC data is consistent with astrophysical constraints, but does not lead to further reduction of EOS uncertainties

Matter at finite temperature and general proton fractions

- evaluation of the grand canonical potential in MBPT:

$$\Omega(T, \mu_n, \mu_p) = -\frac{1}{\beta} \ln \text{Tr} \left(e^{-\beta(H - \mu_n N_n - \mu_p N_p)} \right)$$

- implementation of Gaussian process emulator for efficient interpolation and evaluation of thermodynamic quantities

Keller, KH, Schwenk,
PRL 130, 072701

Jonas
Keller

Negative thermal pressure due to 3N interaction effects

Keller, KH, Schwenk,
PRL 130, 072701

- thermal pressure: $P_{\text{th}}(T) = P(T) - P(T = 0)$
- $P_{\text{th}}(T)$ becomes negative at higher densities due to contributions from 3N interactions
- robust for different chiral interactions, chiral orders and cutoff values

Neutron star matter

- incorporation of beta equilibrium

$$m_n + \mu_n = (m_p + \mu_p) + (m_e + \mu_e)$$

$$\mu_n - \mu_p = -\frac{\partial F}{\partial x} \frac{1}{N}$$

- comparison to uncertainty band (2013):
 - » inclusion of interactions up to N3LO
 - » no RG transformations
 - » systematic EFT convergence
 - » no parametrisation in proton fraction
 - » no approximations in 3NF treatment in MBPT diagrams
 - » calculations to higher densities

Summary and open questions

Summary and open questions

Summary and open questions

chiral EFT interactions

$$n \sim [0.5, 1.5 - 2]n_0$$

calculations for wide range of conditions, tightest constraints for neutron-rich matter

functional RG calculations based on QCD

$$n > 3n_0 - 4n_0$$

still under active development, can be extended to general conditions

perturbative QCD calculations

$$n > 50n_0$$

including thermodynamic relations:

$$n > 10n_0$$

still under discussion to what extent it provides additional constraints for EOS relevant for NSs

Summary and open questions

chiral EFT
interactions

$$n \sim [0.5, 1.5 - 2]n_0$$

calculations for wide range of conditions, tightest constraints for neutron-rich matter

functional RG calculations
based on QCD

$$n > 3n_0 - 4n_0$$

still under active development, can be extended to general conditions

chiralEFT+causality
+NS mass constraints

$$n \sim [1.5 - 8]n_0$$

provides bulk part of model-independent constraints at intermediate densities

perturbative QCD
calculations

$$n > 50n_0$$

including
thermodynamic
relations:

$$n > 10n_0$$

still under discussion to what extent it provides additional constraints for EOS relevant for NSs
