

# **KAMPAI - Kaonic, Antiprotonic, Muonic, Pionic and “onia” exotic Atoms: Interchanging knowledge and recent results**

## **Experimental challenges in study kaon-nucleon interaction at low energy at DAΦNE collider**

**Florin Sirghi on behalf of  
SIDDHARTA-2 Collaboration**

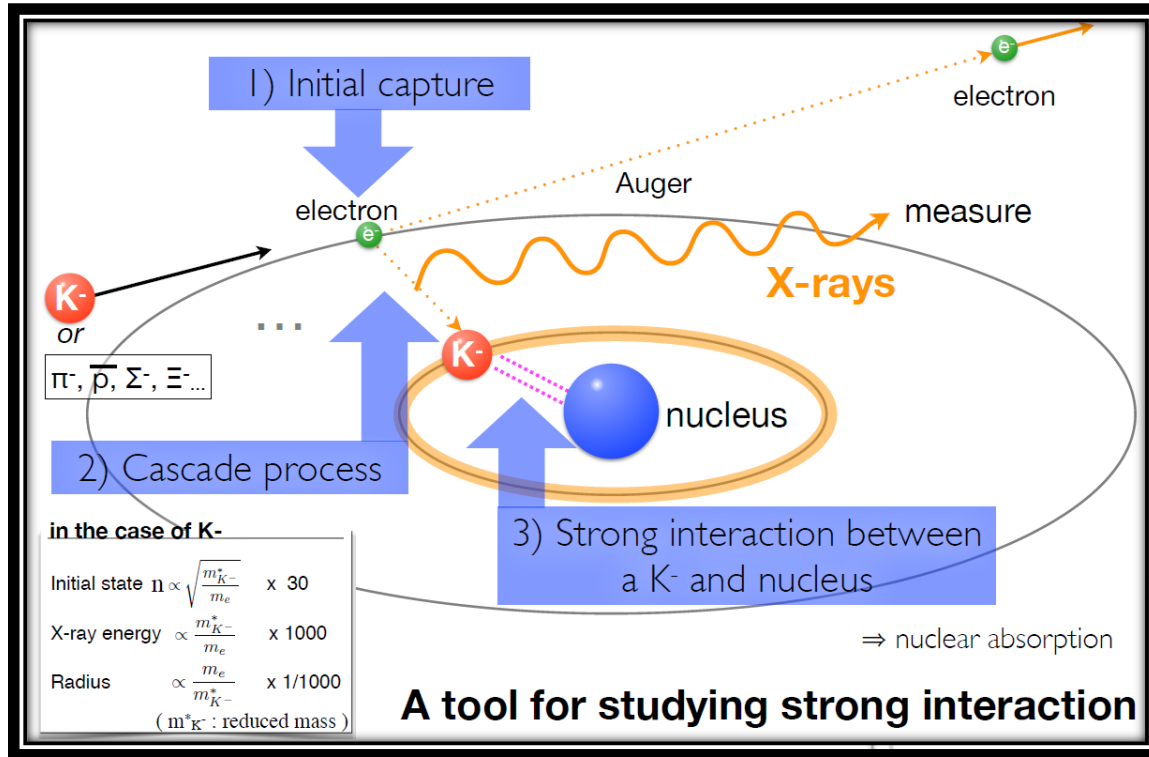

**Istituto Nazionale di Fisica Nucleare  
LABORATORI NAZIONALI DI FRASCATI**

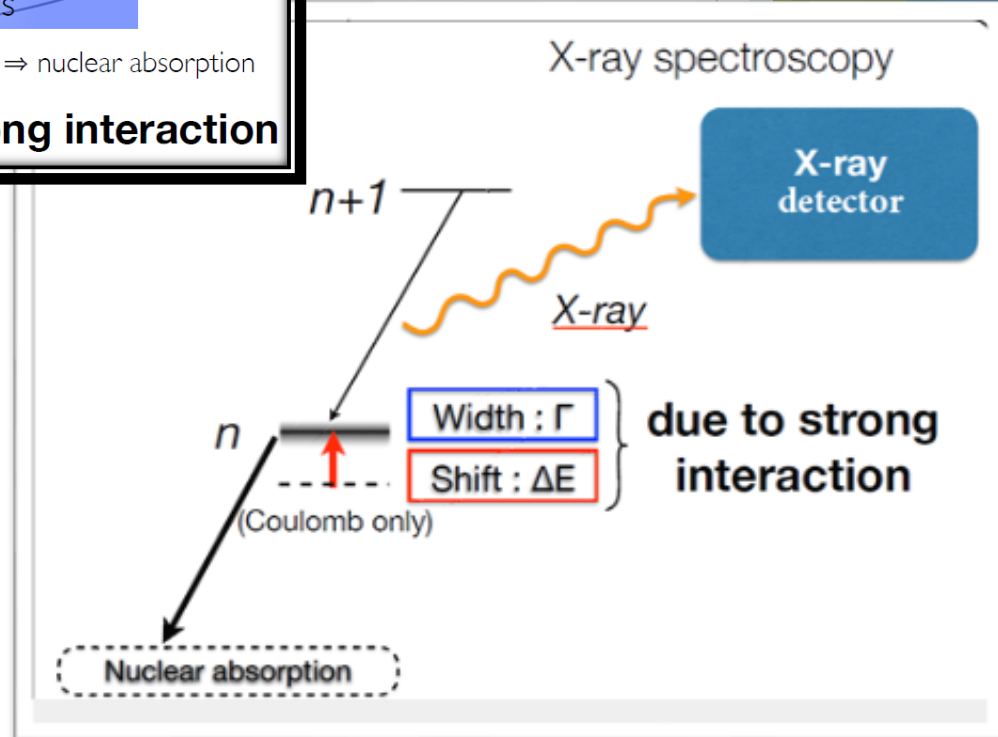

**ECT\* Trento, 30 October-4 November 2024**

# KAONIC ATOMS RESEARCH

Kaonic atoms are formed by stopping a *negatively charged kaon* in a target medium  
**H, He, D, N, ...**  
**Li, Be, C, Al, ...**

Strong interaction induced width  $\Gamma$  and shift  $\epsilon$  obtained by measuring the X-rays emitted

**IDEAS**

**Kaon Beam**

**Experimental setup**

**Motivated TEAM**

# IDEAS

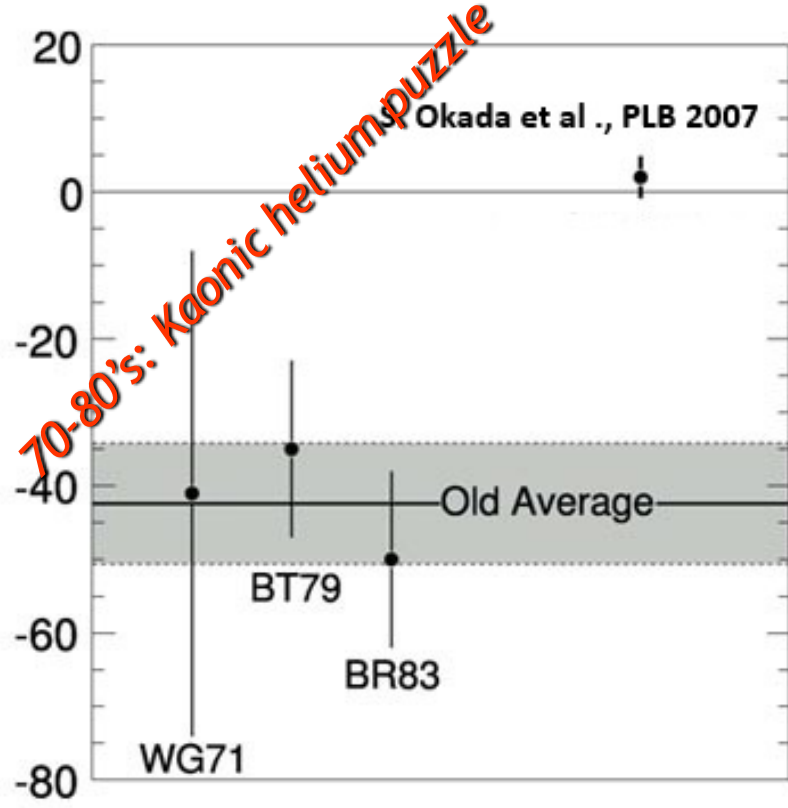

The study of exotic atoms were started by **E. Fermi and E. Teller (1940)**, who postulated the existence of muonic atoms. Characteristic X-rays from pionic and muonic atoms were identified in the early 1950s.

Previous Kaonic X-ray Measurements

70-80's: Kaonic hydrogen puzzle

$\Delta E_{2p}$  [eV]

70-80's: Kaonic helium puzzle

# IDEAS

**Carlo Guaraldo** was the initiator of kaonic atoms studies at the DAΦNE collider

“The most important experiment to be carried out in low energy K-meson physics today is the **definitive determination of the energy level shifts in the K-p and K-d atoms**, because of their direct connection with the physics of  $\bar{K}N$  interaction and their complete independence from all other kinds of measurements which bear on this interaction”.

**R. H. Dalitz (1982)**

# Kaon Beam

Primary beam: 30 GeV/c protons  
 Repetition cycle: 5 sec  
 Flat top: 3 sec  
 Production target: Au  
 Kaon momentum: 1.2 GeV/c (max.)

activities using the unique kaon beams available at J-PARC and DAΦNE.

DAΦNE collider at LNF

Veto systems

**DEAR experiment (2001 - 2005)**  
 (DAΦNE Exotic Atom Research) *kaonic hydrogen, kaonic nitrogen*  
 Detector technology: Charge Coupled Device (CCD)

**CCD55-30 Marconi Applied Technologies**  
 1152 x 1242 pixels / chip  
 pixel size 22.5 x 22.5  $\mu\text{m}$   
 total area per chip **7.24 cm<sup>2</sup>**  
 depletion depth ~ 30  $\mu\text{m}$   
 read-out time per CCD **120 sec.**  
 energy resolution ~ **150 eV @ 6keV**  
 temperature stabilized ~ 165 K

# Charge Coupled Device (CCD)

X-ray detection  
with CCDs

J.-P. Egger, EXA - 02, Vienna

- CCD pixel detectors
- CCD principle
  - direct X-ray detection
  - background
  - energy resolution
  - measurement time
  - efficiency

CCDs are excellent soft X-ray detectors!

but:

- limited energy range
- measuring time
- no trigger
- transparency of Si to X-rays

Problems in soft X-ray detection:

- background
  - windows (gas targets)
- } low signal  
} high background

Ideal detector: surface, energy + position  
resolution, efficiency, background suppression  
energy versus position mode

# Charge Coupled Device (CCD)

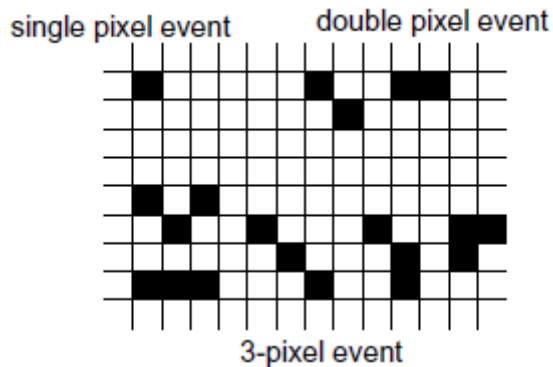

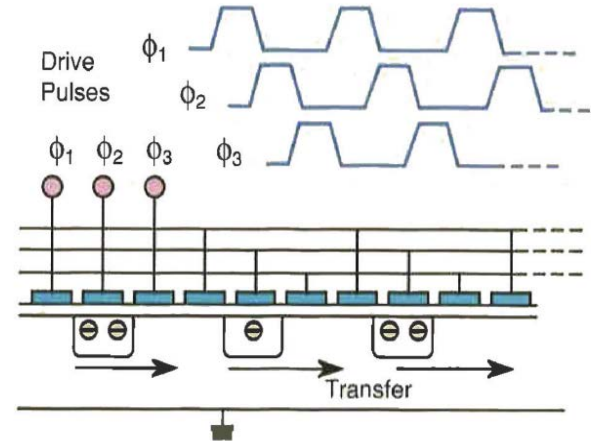

X-ray detector  
characterization:

- temperature stability
- gain stability vs X-ray rates
- Good Energy resolution
- Linearity measurements

Charge transport correction

Topological selection for  
background reduction

peak position vs pixel  
coordinates

# SIDDHARTA (2004 - 2010)

(Silicon Drift Detectors for Hadronic Atoms Research by Timed Application)

KH, Kd,  $KHe^3$ ,  $KHe^4$

Detector technology : Silicon Drift Detectors (first large area) with integrated JFET

PNSensor

**New x-ray detectors** specially designed as well as readout electronics

energy range < **20 keV**

energy resolution better than **150 eV (FWHM) at 6 keV**;

stability and linearity better than  $10^{-4}$ ;

Fast detector - > **trigger** system at the level of **1μs**;

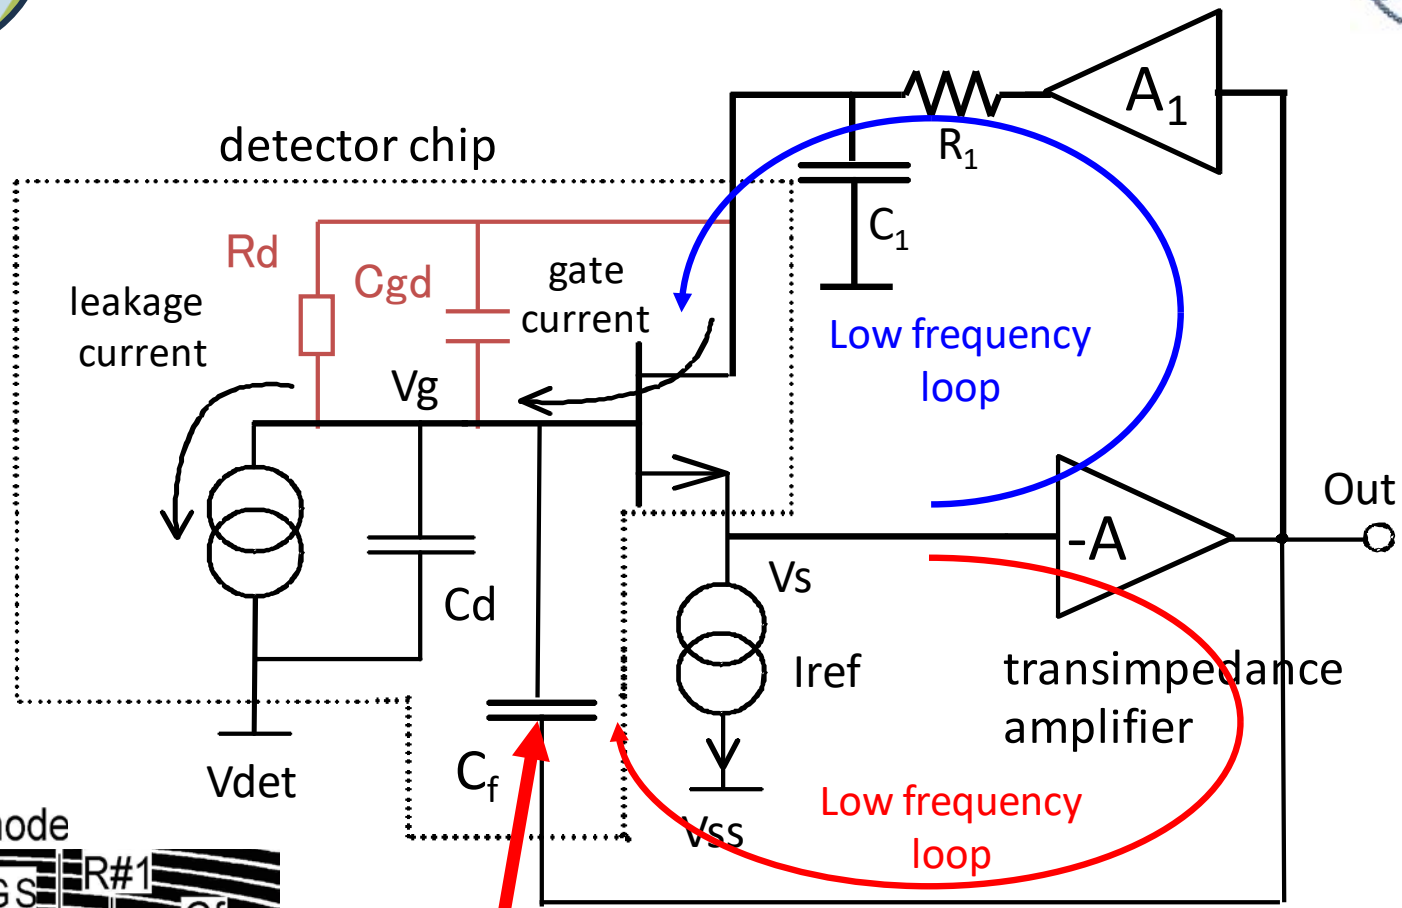

Operating in high radiation environment;

Custom topology – **large active area (~ cm<sup>2</sup> / channel)**

# New SDD Charge Preamplifier configuration

**Integrated feedback capacitor**

\* World first application

# SIDDHARTA-2 (2019 -2024)

Veto-1

Target

Veto-2

384 SDDs

Kaon Trigger

Veto-3

Bottom kaon  
detector

# SIDDHARTA-2 setup: cryogenics

- ✓ new solutions for the cooling scheme - target separated from SDD
- ✓ Better control of target parameters (pressure, temperature, density,...)

❖ Target + SDD cooling

Leybold MD10 - 18 W @ 20 K  
target cell and SDDs are cooled  
via ultra pure aluminum bars

$$T_{TC} = 20-30 \text{ K}$$

$$T_{SDD} \sim 130 \text{ K}$$

✓ Second stage  
dedicated to target  
cooling

# SIDDHARTA-2 setup: cryogenic targets

- ✓ **Selected materials in different configuration:**
  - vacuum entrance windows**
  - target walls**
  - cooling supports**

**would eliminate Nitrogen and Oxygen contamination**

# SIDDHARTA-2 setup: cryogenics

- ✓ Dedicated lines for SDD cooling
- ✓ Better control of target parameters
- ✓ (pressure, temperature, density,...)

Thermal Simulations with  
copper block at 50 K

✓ First stage  
dedicated only to SDD cooling

Cooling power  
1st stage ~ 115 W @ 80 K  
2nd stage ~ 18 W @ 20 K

# SDD with external CUBE preamplifier

New monolithic SDDs arrays have been developed by **Fondazione Bruno Kessler**

new technology, lower production cost

- 2x4 matrix SDD units ( $0.64 \text{ cm}^2$ )
- active/total surface ratio of 0.75

1mm screws and springs

SIDDHARTA-2  
Ceramic carrier

A CMOS low-noise charge sensitive preamplifier (CUBE) operate at lower **cryogenic** temperature (up to 50k)

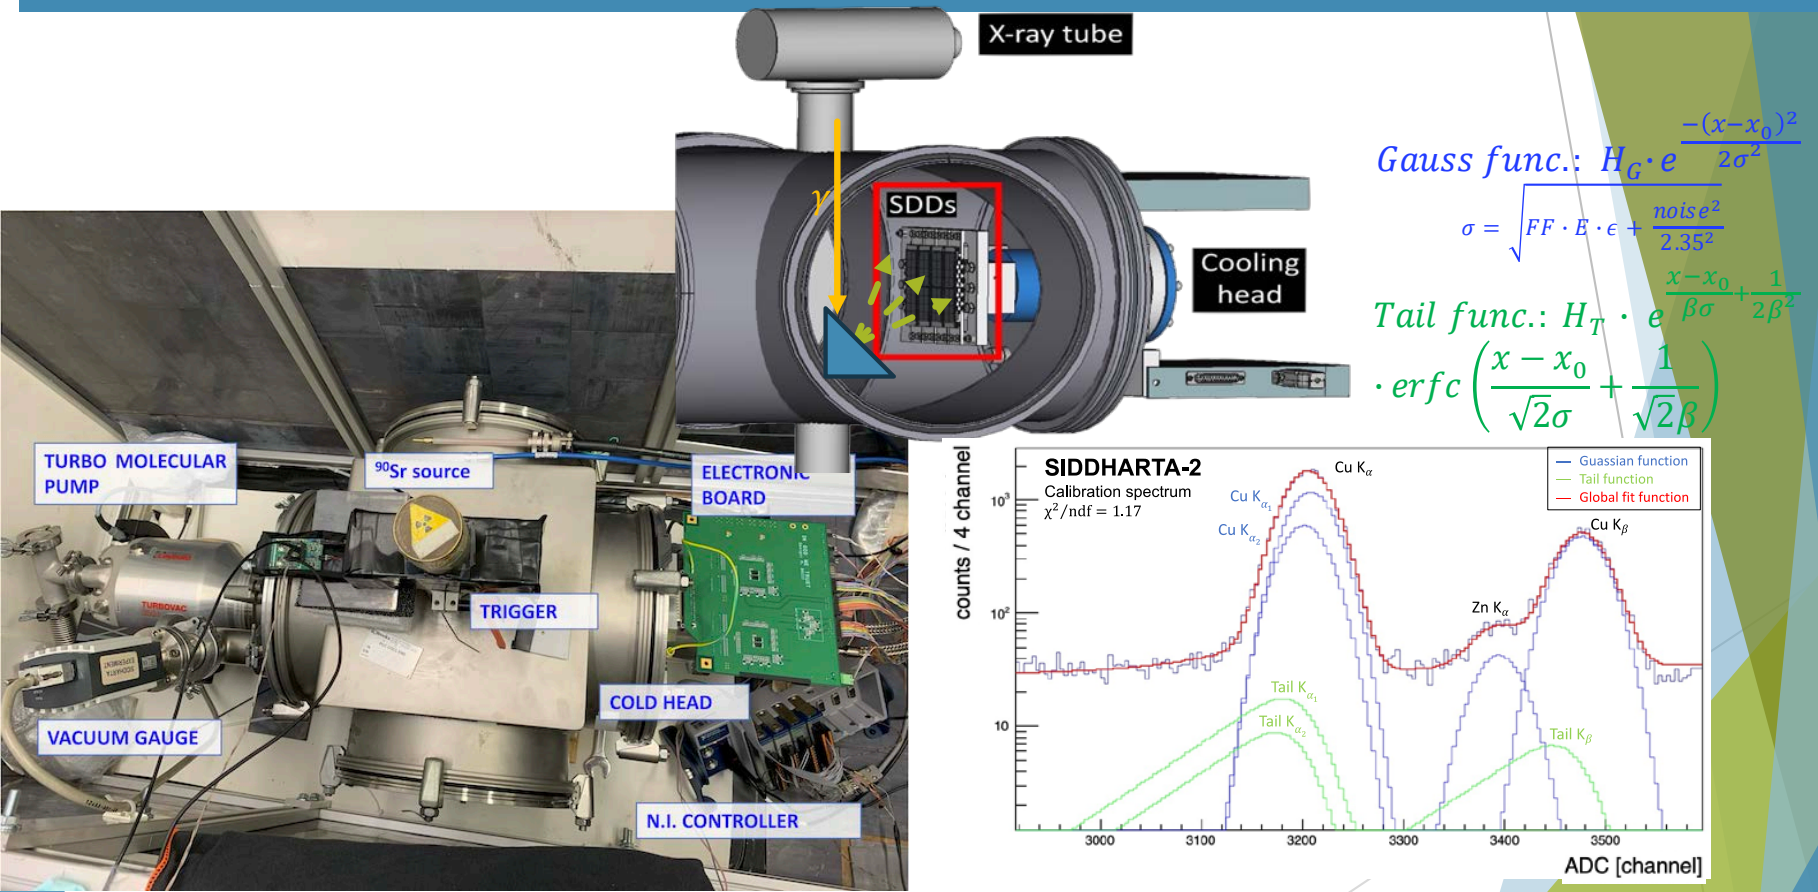

# SDDs Calibration Procedure in DAΦNE

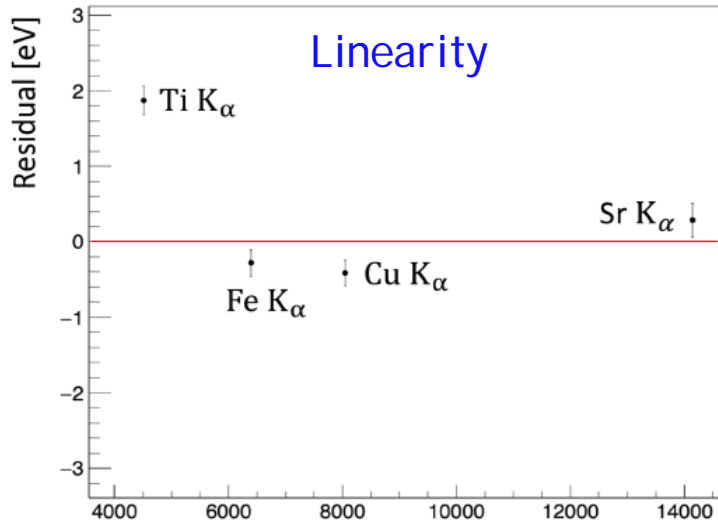

# Silicon Drift Detectors (2020-2021) laboratory tests

Characterization and optimization of the SDDs energy and time response in preparation for the SIDDHARTA-2 experiment

# Silicon Drift Detectors spectroscopy response

The energy response is linear within few ( $< 5$  eV between 4 keV and 14 keV)  
Excellent energy and time resolution @ 140 K

# Monte Carlo simulations, modern algorithms and machine learning techniques

**Optimization of the setup and  
detectors response (degrader curve,  
trigger, SDDs, veto, ...)**

# SIDDHARTA-2 setup: kaon trigger and luminosity monitor

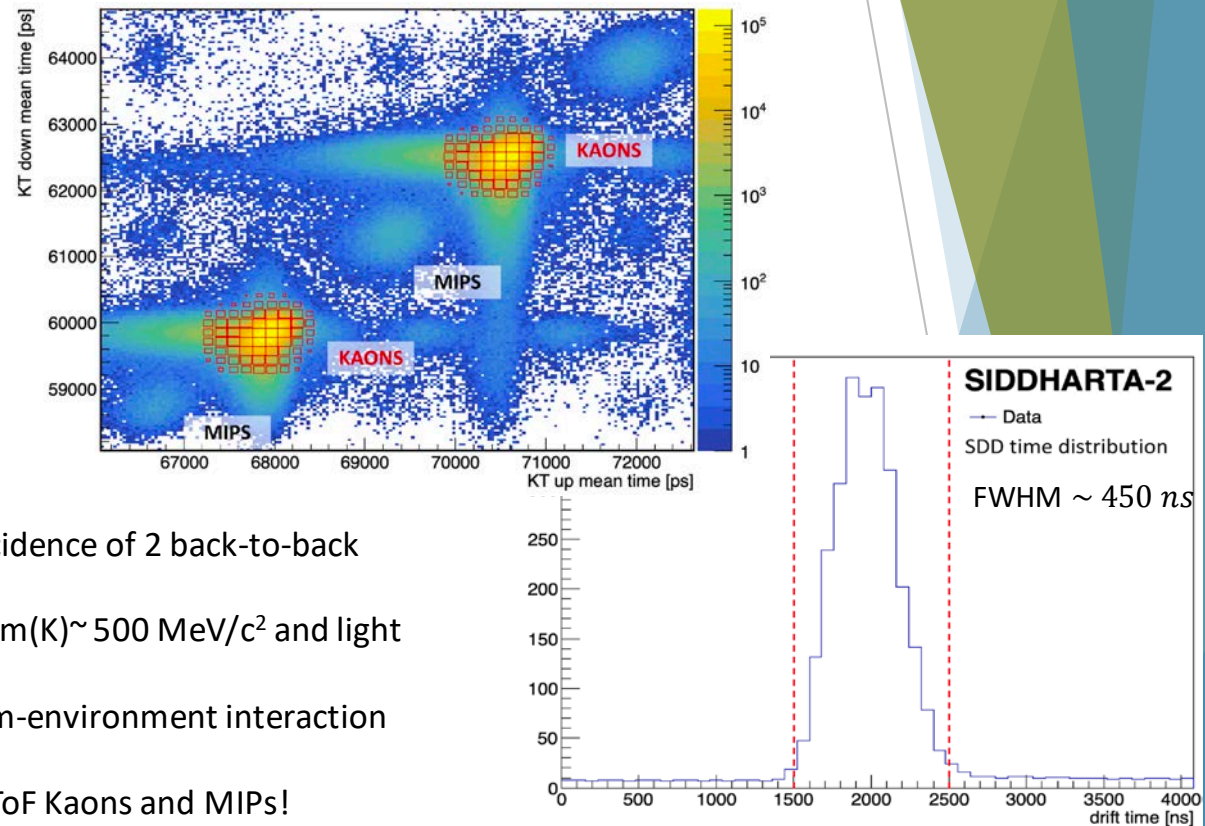

**Kaon Trigger** consists of two plastic scintillators read by PMT's placed above and below the IR.

New support structures

The **Luminosity monitor** consists of two plastic scintillators in the horizontal plane

# SIDDHARTA-2 setup: kaon trigger and luminosity monitor

The combined use of Kaon Trigger and SDDs drift time allows to reduce the asynchronous background by a factor  $\sim 2 \cdot 10^4$

The trigger is generated by the coincidence of 2 back-to-back scintillators  
The ToF is different ( $\sim 2$  ns) for Kaons,  $m(K) \sim 500$  MeV/c<sup>2</sup> and light particles originating from beam-beam and beam-environment interaction (MIPs).  
Can efficiently discriminate by ToF Kaons and MIPs!

# SIDDHARTA-2 setup: Bottom Kaon Detector

Stop both  $K^+$  and  $K^-$  in a passive layer (Teflon) and detect secondaries in a scintillator

2 mm teflon  
5-10 mm thick scintillator

Immediate prompt  
**83%** crossing probability

$\pi^-$

Delayed prompt  
**53%** crossing probability

$\pi^+$

Bottom Kaon detector

# SIDDHARTA-2 setup: veto systems

VETO system adds - VETO-3

- 2 pairs of scintillator  
640 x 130 x 10 mm<sup>3</sup> Scionix EJ-200
- R10533 PMTs Hamamatsu

- light-guides
- Al tube +  $\mu$ Metal (0.1mm)
- reflective and light proof foil
- optical cement

# SIDDHARTA-2 setup: shielding

- Improve the lateral shielding around the vacuum chamber after adding VETO3 detector

- Redesign and complete the bottom shielding near to IR

# Project Timeline – Kaonic deuterium run completed

- **First run with SIDDHARTA-2** optimized setup for  $200 \text{ pb}^{-1}$  integrated luminosity: May – July 2023 - completed
- **Second run** Autumn – Winter 2023 goal: estimated  $300\text{-}400 \text{ pb}^{-1}$  completed
- **Third run 2024** – goal:  $400 \text{ pb}^{-1}$  – completed
- **Post-Calibration:** goal  $100\text{-}150 \text{ pb}$  – completed

Goal: integrated luminosity  $\sim 200 \text{ pb}^{-1}$  (with injections)

**End of kaonic deuterium Run1**

2023, July

Total:  $\sim 200 \text{ pb}^{-1}$

Goal: integrated luminosity  $\sim 300\text{-}400 \text{ pb}^{-1}$

**End of kaonic deuterium Run2**

2023, December

Total:  $\sim 344 \text{ pb}^{-1}$

HPGe and CdZnTe

Goal: integrated luminosity  $\sim 400 \text{ pb}^{-1}$

**End of kaonic deuterium Run3**

2024, April

Total:  $\sim 450 \text{ pb}^{-1}$  (to ensure  $800 \text{ pb}^{-1}$  of useful data)

Integrated luminosity  $150\text{-}200 \text{ pb}^{-1}$  (1 month)

**Extension of the SIDDHARTA-2 run, also as post-calibration**

2024, July

Total:  $\sim 200 \text{ pb}^{-1}$  (low density run)

**$\sim 1200$  shifts for a total of  $\sim 10\,000$  hours of data taking and  $\sim 1700 \text{ pb}^{-1}$  delivered by DAΦNE allowed to perform the kaonic deuterium, helium, neon and hydrogen measurements**

**SPARE**

EXtensive  
Kaonic  
Atoms research: from  
Lithium and  
Beryllium to  
URanium

## Future plans

- *proposal to perform fundamental physics at the strangeness frontier at DAΦNE for a 3-years period (post-SIDDHARTA-2)*
- *presented in various Scientific Comity and INFN commissions*

Kaonic Hydrogen:  $200 \text{ pb}^{-1}$  - with SIDDHARTA2 setup - to get a precision  $< 10 \text{ eV}$  (KH)

Selected light kaonic atoms (LHKA)

Selected intermediate and heavy kaonic atoms charting the periodic table (IMKA)

Ultra-High precision measurements of Kaonic Atoms (UHKA)

Dedicated runs with different types of detectors:  
SDD 1mm, CZT detectors – R&D in advanced phase  
HPGe, crystal HAPG spectrometer-VOXES project
