The astrophysical i process

Nature Reviews (accepted)

i process calculations signatures

Herwig, Denissenkov

- Ba/La vs La/Eu sensitive to astrophysical conditions
- s and r process stars exhibit different abundance ratios
- Simple one zone model changing the neutron density
- Group of stars not explained by s or r neutron densities

The issue with neutron capture reactions

- Measuring Neutron Capture reactions on short-lived nuclei is challenging
- Cannot make a neutron target
- Cannot make a target out of a short-lived isotope
- Need indirect techniques

Neutron Captures

- Direct measurement of (n,γ) reactions on short-lived isotopes: challenging
- Indirect techniques to provide constraints

Hauser – Feshbach (Statistical Model)

- Nuclear Level Density (NLD)
- γ -ray strength function (γ SF)
- Optical model potential

β -Oslo method

•Need:

- ✓ Radioactive Beam
- ✓ Segmented γ -ray calorimeter:

$$E_x = E_{\gamma 1} + E_{\gamma 2} + E_{\gamma 3} + E_{\gamma 4} + \dots$$

- Disadvantage: limited by Q-value, S_n , nuclear structure
- Advantage of β -decay: feasible with low beam intensities

$^{139}\text{Ba}(n,\gamma)^{140}\text{Ba}$

- Verified that within the specific model, 10^{13}n/cm^3 is a viable neutron density to reproduce observations
- Can be used to identify conditions that could reproduce specific stars
- New: $^{151}\text{Nb}(n,\gamma)^{152}\text{Nb}$ to constrain Eu

i process around $A=90$

- Stable isotopes
- Known unstable isotopes
- Unstable isotopes predicted to exist

The Sr puzzle: i-process models

Wiedeking et al, *Nature Reviews* (accepted 2025)

i process around A=90

- $^{88}\text{Kr}(n,\gamma)^{89}\text{Kr}$ – has the largest impact on the Sr and Y abundances
- $^{87}\text{Kr}(n,\gamma)^{88}\text{Kr}$ also identified affecting Rb (Muecher et al. PRClett2023, Uthayakumaar et al., PRC submitted)
- $^{90,92}\text{Sr}(n,\gamma)^{91,93}\text{Sr}$ affecting Zr (Sweet et al PRC2024, Greaves et al, PRC accepted)

$T_{1/2} = 2.8 \text{ h}$

The $^{88}\text{Kr}(n,\gamma)^{89}\text{Kr}$ reaction

Artemis Spyrou – Trento 2025 22

Summary

- Neutron-capture reactions important for i-process calculations
- Direct measurements not currently possible. Have to rely on indirect techniques
- New results in the **mass 90 and 140 regions** help constrain i-process conditions
- Closer look into statistical properties (nuclear level density and gamma strength function)
- FRIB will bring new capabilities and access to a lot more exotic nuclei – **explore the endpoint of the i process**
