Triangle
$D_{3 h}$
$\mathrm{k}=4$

Tetrahedron
$\mathrm{T}_{\mathrm{d}}$

${ }^{20} \mathrm{Ne} \quad$ Trigonal bipyramid $\quad \mathrm{D}_{3 \mathrm{~h}}$

${ }^{24} \mathrm{Mg} \quad$ Triaxial bipyramid $\quad \mathrm{D}_{2 \mathrm{~h}}$

Octahedral?
$\mathrm{O}_{\mathrm{h}}$

Open questions 2019

- What are the signatures of symmetry in clustering
- How far cluster extends in excitation energy
- How far it extends in mass number

An answer to the first question can be obtained by a novel theoretical approach: the Algebraic Cluster Model (ACM)
This model provides explicit analytic expressions for all observables: energies, electromagnetic transitions, form factors,...
$\Rightarrow$ Part of the simplicity in complexity program
An answer to the second and third question can be obtained by new experiments.

## ALGEBRAIC CLUSTER MODEL (ACM)

Algebraic structure U(3k-2)
Bosonic quantization of the Jacobi variables according to the general quantization scheme『 for problems with $v$ degrees of freedom, $\mathrm{U}(\mathrm{v}+1)$.
This approach bypasses the solution of the Schrödinger equation for k interacting $\alpha$-particles.

『 F. Iachello, in Lie Algebras, Cohomologies and New Applications of Quantum Mechanics, N. Kamran and P. Olver eds., Contemporary Mathematics, Vol. 160, p.151, Amer. Math. Soc., Providence, RI, 1994.

Explicit construction of the algebra completed for $\mathrm{k}=2,3,4$

## CLASSIFICATION OF STATES

The discrete symmetry of cluster states imposes conditions on the allowed quantum states.

Mathematical method for determining the allowed states (i.e. constructing representations of the discrete group G): Diagonalization of the symmetry adapter operators
$\Rightarrow$ Expected states $\mathrm{L}^{\mathrm{P}}$ for $\mathrm{k} \alpha$ configurations $(\mathrm{k}=2,3,4)$ with $\mathrm{Z}_{2}$, $D_{3 h}$ and $T_{d}$ symmetry.
${ }^{8} \mathrm{Be}$
$\mathrm{k}=2$

| $\bigcirc-\mathrm{O}$$-44^{+}$ | - | $4^{+}$ |
| :---: | :---: | :---: |
|  | - | $2^{+}$ |
| - $2^{+}$ | A <br> (1) | $0^{+}$ |
| $\begin{array}{cc}  & 0^{+} \\ \text {(0) } & \end{array}$ |  |  |

A irreps: $\mathrm{L}^{\mathrm{P}=0^{+}, 2^{+}, 4^{+}, \ldots}$

Vibrations of a $2 \alpha$ configuration

A irreps: $\mathrm{L}^{\mathrm{P}}=0^{+}, 2^{+}, 3^{-}, 4^{ \pm}, \ldots(\mathrm{K}=0,3,6, \ldots)$
E irreps: $\mathrm{L}^{\mathrm{P}=1^{-}, 2^{ \pm}, 3^{ \pm}, \ldots(\mathrm{K}=1,2,4,5, \ldots), ~(\mathrm{Cl}}$
Both positive and negative parity states sit in the same irrep because of the lack of reflection symmetry of a $\mathrm{D}_{3}$ configuration: parity doubling!

A irreps: $\mathrm{L}^{\mathrm{P}=0^{+}, 3^{-}, 4^{+}, 6^{ \pm}, \ldots}$
E irreps: $\mathrm{L}^{\mathrm{P}}=2^{ \pm}, 4^{ \pm}, 5^{ \pm}, 6^{ \pm}, \ldots ;$ F irreps: $1^{-}, 2^{+}, 3^{ \pm}, 4^{ \pm}, \ldots$ Both positive and negative parity states in the same irrep: Parity doubling!

## ENERGY FORMULAS

Within $\mathrm{U}(3 \mathrm{k}-2)$, in the large N limit, it is possible to derive energy formulas. These formulas are identical to those used in physical chemistry to study molecular structures. For a rigid roto-vibrator these are:
$2 \alpha \quad E(v, L)=E_{0}+\omega\left(v+\frac{1}{2}\right)+B L(L+1)$
$3 \alpha \quad E\left(v_{1}, v_{2}, L, K\right)=E_{0}+\omega_{1}\left(v_{1}+\frac{1}{2}\right)+\omega_{2}\left(v_{2}+1\right)+B L(L+1)+(A-B)\left(K \mp 2 \ell_{2}\right)^{2}$
$4 \alpha \quad E\left(v_{1}, v_{2}, v_{3}, L\right)=E_{0}+\omega_{1}\left(v_{1}+\frac{1}{2}\right)+\omega_{2}\left(v_{2}+1\right)+\omega_{3}\left(v_{3}+\frac{3}{2}\right)+B L(L+1)$
Linear

Symmetric top
Spherical top

## ELECTROMAGNETIC TRANSITIONS

Within $\mathrm{U}(3 \mathrm{k}-2)$ it is also possible to calculate all properties in explicit analytic form
(a) $\mathrm{B}(\mathrm{EL})$ values along the rotational band
$2 \alpha \quad B(E L ; 0 \rightarrow L)=\left(\frac{Z e \beta^{L}}{2}\right)^{2} \frac{2 L+1}{4 \pi}\left[2+2 P_{L}(-1)\right]$
$3 \alpha \quad B(E L ; 0 \rightarrow L)=\left(\frac{Z e \beta^{L}}{3}\right)^{2} \frac{2 L+1}{4 \pi}\left[3+6 P_{L}\left(-\frac{1}{2}\right)\right]$
$4 \alpha \quad B(E L ; 0 \rightarrow L)=\left(\frac{Z e \beta^{L}}{4}\right)^{2} \frac{2 L+1}{4 \pi}\left[4+12 P_{L}\left(-\frac{1}{3}\right)\right]$
(b) Form factors in electron scattering

$$
F_{L}(0 \rightarrow L ; q)=c_{L} j_{L}(q \beta)
$$

$2 \alpha \quad c_{L}^{2}=\frac{2 L+1}{4}\left[2+2 P_{L}(-1)\right] \quad c_{0}^{2}=1, c_{2}^{2}=5, c_{4}^{2}=9$
$3 \alpha \quad c_{L}^{2}=\frac{2 L+1}{9}\left[3+6 P_{L}\left(-\frac{1}{2}\right)\right] \quad c_{0}^{2}=1, c_{2}^{2}=\frac{5}{4}, c_{3}^{2}=\frac{35}{8}, c_{4}^{2}=\frac{81}{64}$
$4 \alpha \quad c_{L}^{2}=\frac{2 L+1}{16}\left[4+12 P_{L}\left(-\frac{1}{3}\right)\right] \quad c_{0}^{2}=1, c_{3}^{2}=\frac{35}{9}, c_{4}^{2}=\frac{7}{3}, c_{6}^{2}=\frac{416}{81}$

## COMPARISON WITH EXPERIMENT: ENERGIES

The occurrence of $Z_{2}$ symmetry in ${ }^{8} \mathrm{Be}$ was emphasized by many authors and confirmed by recent experiments.

The occurrence of $\mathrm{D}_{3}$ symmetry in ${ }^{12} \mathrm{C}$ has been confirmed by recent experiments (Freer, Gai et al. $)^{\boldsymbol{\pi}}$.

The occurrence of $\mathrm{T}_{\mathrm{d}}$ symmetry in ${ }^{16} \mathrm{O}$ was emphasized by Robson\# (1978-1982) and more recently revisited by Bijker (2014) .

## CHARGE AND MATTER DENSITIES IN ACM

Charge and matter densities can be calculated analytically in ACM. They are obtained by convoluting the charge (and matter) density of the point-like cluster with that of the $\alpha$-particle, parametrized as a Gaussian

$$
\rho_{\alpha}(r)=\left(\frac{\alpha}{\pi}\right)^{3 / 2} e^{-\alpha r^{2}} \quad \alpha=0.56 \mathrm{fm}^{-2} \longleftarrow \text { From }\left\langle r^{2}\right\rangle^{1 / 2} \text { of }{ }^{4} \mathrm{He}
$$

and are given in terms of the distance, $\beta$, of the alphaparticles from the center of mass

Charge (and matter) densities in clusters with $\mathrm{k}=2,3,4$ and symmetry $\mathrm{Z}_{2}$, $\mathrm{D}_{3 \mathrm{~h}}$ and $\mathrm{T}_{\mathrm{d}}{ }^{\text {a }}$.

$$
\begin{gathered}
\rho(\vec{r})=\sum_{\lambda \mu} \frac{Z e}{k} f_{\lambda}(r) Y_{\lambda \mu}(\vartheta, \varphi) \sum_{i=1}^{k} Y_{\lambda \mu}^{*}\left(\vartheta_{i}, \varphi_{i}\right) \\
f_{\lambda}(r)=\left(\frac{\alpha}{\pi}\right)^{3 / 2} e^{-\alpha\left(r^{2}+\beta^{2}\right)} 4 \pi i_{\lambda}(2 \alpha \beta r)
\end{gathered} \sum_{i=1}^{2} Y_{\lambda \mu}^{*}=\delta_{\mu, 0} \sqrt{\frac{2 \lambda+1}{4 \pi}}\left[1+P_{\lambda}(-1)\right] \quad \begin{aligned}
& \sqrt{\frac{2 \lambda+1}{4 \pi}}\left[1+2 P_{\lambda}\left(-\frac{1}{2}\right)\right] ; \mu=0 \\
& \sum_{i=1}^{3} Y_{i \mu \mu}^{*}=\left\{\begin{array}{l}
\sqrt{\frac{2 \lambda+1}{4 \pi}} \sqrt{\frac{(\lambda+\mu)!}{(\lambda-\mu)!}} 2 P_{\lambda}^{-\mu}\left(-\frac{1}{2}\right) ; \mu=2 k \neq 0
\end{array}\right\} \\
& \sum_{i=1}^{4} Y_{\lambda \mu}^{*}=\left\{\begin{array}{l}
\sqrt{\frac{2 \lambda+1}{4 \pi}}\left[1+3 P_{\lambda}\left(-\frac{1}{3}\right)\right] ; \mu=0 \\
\sqrt{\frac{2 \lambda+1}{4 \pi}} \sqrt{\frac{(\lambda+\mu)!}{(\lambda-\mu)!}} 3 P_{\lambda}^{-\mu} ; \mu=3 k \neq 0
\end{array}\right\}
\end{aligned}
$$

\end{array} \\
\mathrm{T}_{\mathrm{d}}, \quad E(\Omega, J, K)=\varepsilon_{\Omega}+\mathrm{A}_{\Omega}\left[J(J+1)+a_{\Omega} g_{\Omega}(J)\right]
\end{array}
$$

§ V. Della Rocca and F. Iachello, Nucl. Phys. A 973, 1 (2018).

## EVIDENCE FOR $Z_{2}$ AND $D_{3 h}$ SYMMETRY

The group $\mathrm{D}^{\prime}{ }_{3 \mathrm{~h}}$ has three spinor representations. The allowed values of $\mathrm{K}^{\mathrm{P}}$ for each of them is given by:
$\Omega=E_{1 / 2}^{(+)}: \longrightarrow K^{P}=1 / 2^{+}$
${ }^{13} \mathrm{C}$
$\Omega=E_{1 / 2}^{(-)}: \longrightarrow \quad K^{p}=1 / 2$
$\Omega=E_{3 / 2}:$

$$
K=3 n \pm \frac{1}{2}, P=(-)^{n+1}
$$

$K^{P}=\left(3 n-\frac{3}{2}\right)^{ \pm}$
with $\mathrm{n}=1,2,3, \ldots$, and $\mathrm{K}>0$. The angular momenta of each $K$ are $\mathrm{J}=\mathrm{K}, \mathrm{K}+1, \mathrm{~K}+2, \ldots$

Ground state band assigned to the representation $\Omega=E_{1 / 2}^{(-)}$of $\mathrm{D}^{\prime}{ }_{3 \mathrm{~h}}$ with $\mathrm{A}=0.942 \mathrm{MeV}, \mathrm{b}=-0.62$ and $\mathrm{a}=0$.

## ELECTROMAGNETIC TRANSITIONS

$$
\begin{aligned}
& B\left(\lambda ; \Omega^{\prime}, I^{\prime}, M^{\prime}, K^{\prime} \rightarrow \Omega, I, M, K\right)= \\
& =\left\|\left[\begin{array}{l}
\left\langle I^{\prime}, K^{\prime}, \lambda, K-K^{\prime} \mid I, K\right\rangle\left(\delta_{v, v^{\prime}} G_{\lambda}\left(\Omega, \Omega^{\prime}\right)+\delta_{\Omega, \Omega}, G_{\lambda, c}\right)+ \\
(-)^{I+K}\left\langle I^{\prime}, K^{\prime}, \lambda,-K-K^{\prime} \mid I,-K\right\rangle\left(\delta_{v v^{\prime}} \tilde{G}_{\lambda}\left(\Omega,-\Omega^{\prime}\right)+\delta_{\Omega,-\Omega} G_{\lambda, c}\right)
\end{array}\right]\right\|^{2}
\end{aligned}
$$

Electric transitions within a rotational band are dominated by the cluster contribution. For $Z^{\prime}{ }_{2}$ symmetry in the ground state band of ${ }^{9} \mathrm{Be}$

$$
\begin{aligned}
& B\left(E 2 ; 3 / 2, I^{\prime} \rightarrow 3 / 2, I\right)=\left(Z e \beta^{2} \sqrt{\frac{5}{4 \pi}}\right)^{2}\left\langle I^{\prime}, 3 / 2,2,0 \mid I, 3 / 2\right\rangle^{2} \\
& Q^{(2)}(3 / 2, I)=\left(\sqrt{\frac{16 \pi}{5}} Z e \beta^{2} \sqrt{\frac{5}{4 \pi}}\right)\langle I, 3 / 2,2,0 \mid I, 3 / 2\rangle\langle I, I, 2,0 \mid I, I\rangle
\end{aligned}
$$

Magnetic transitions and magnetic moments are dominated by the single particle contribution

$$
\mu^{(1)}(3 / 2, I)=\sqrt{\frac{4 \pi}{3}}\langle I, 3 / 2,1,0 \mid I, 3 / 2\rangle\langle I, I, 1,0 \mid I, I\rangle G_{1}(3 / 2)
$$

## FORM FACTORS

$$
F_{\lambda}=F_{\lambda}^{s . p .}+F_{\lambda}^{c}
$$

Electric transitions are dominated by the cluster contribution

$$
\begin{aligned}
& F_{\lambda}^{c}\left(q ; J, K \rightarrow J^{\prime}, K^{\prime}\right) \\
& =\delta_{K, K^{\prime}} \cdot Z \sqrt{\frac{2 \lambda+1}{4 \pi}} c_{\lambda}\left\langle J, K, \lambda, 0 \mid J^{\prime}, K^{\prime}\right\rangle j_{\lambda}(q \beta) e^{-q^{2} / 4 \alpha}
\end{aligned}
$$

Electric longitudinal form factors
${ }^{9} \mathrm{Be}$

Elastic $3 / 2 \longrightarrow 3 / 2$
Inelastic $3 / 2 \longrightarrow 5 / 2$ and $3 / 2 \longrightarrow 7 / 2$

Electric longitudinal form factors

$\mathrm{D}^{\prime}{ }_{3 \mathrm{~h}}$ symmetry predicts equal form factors ! Experimentally verified!

## SUMMARY AND CONCLUSIONS

Symmetry provides analytic expressions for energy levels, electromagnetic transition rates and form factors in $\mathrm{k} \alpha+\mathrm{x}$ nuclei. Evidence has been presented for $\mathrm{k}=2,3,4 ; \mathrm{x}=0\left({ }^{8} \mathrm{Be},{ }^{12} \mathrm{C},{ }^{16} \mathrm{O}\right)$, and $\mathrm{k}=2,3 ; \mathrm{x}=1\left({ }^{9} \mathrm{Be},{ }^{9} \mathrm{~B} ;{ }^{13} \mathrm{C},{ }^{13} \mathrm{~N}\right)$.

All properties are calculated in terms of one parameter, $\beta$, the distance of the $\alpha$-particles from the center of mass.
This parameter can be fixed either from the moment of inertia or from the charge radius.

Particularly interesting is the picture that emerges for nuclei with $\mathrm{k} \alpha$ particles plus x nucleons,

confirming von Oertzen original suggestion.

The results may be used for comparison with experiment and as benchmarks for $a b$ initio calculations of light nuclei.

## ADDITIONAL REMARKS

- Signatures of symmetry in clustering are properties of spectra and electromagnetic transition rates, especially parity doubling, unusual structure of the rotational bands, and enhanced E2, E3, E4, E5, ... transitions.
- Clustering appears to extend at least to angular momentum $\mathrm{J}=6$ in $\mathrm{k}=2,3,4$ systems, and up to excitation energies of the order of 25 MeV .
- Clustering appears to extend up to $\mathrm{A}=16$. [Recent unpublished work on $\mathrm{k}=5$ and $\mathrm{k}=6$ systems appears to indicate that also $\mathrm{A}=20$ and $\mathrm{A}=24$ nuclei have the cluster structure suggested by Brink].
- Clustering appears to survive the addition of nucleons, $\mathrm{x}=1$. [Recent unpublished work on systems with $\mathrm{x}=2,{ }^{10} \mathrm{Be}$, and ${ }^{14} \mathrm{C}$ appears to indicate that systems with $\mathrm{k}=2$ are also clusterized.]

Further confirmation of clustering in light nuclei must come from new experiments. The ACM and its extension CSM make definite (simple) predictions for where states should occur and what are their decay properties, both in $\mathrm{k} \alpha$-structures and in $\mathrm{k} \alpha+\mathrm{x}$ nucleon structures. These experiments could include electron scattering, photon scattering, particle transfer and electromagnetic decay rates.

Symmetry has been for many years one of the primary tools to study systems in molecular, atomic, nuclear and particle physics.
It appears to be so also for cluster physics with a combination of both discrete and continuous symmetries!
