Quantum geometry and BEC

Quantum geometry and light-matter interactions

SUPERCONDUCTIVITY

WHY NOT AT ROOM TEMPERATURE?

Highest T_c (ambient pressure) ~150 K – just a factor of two!

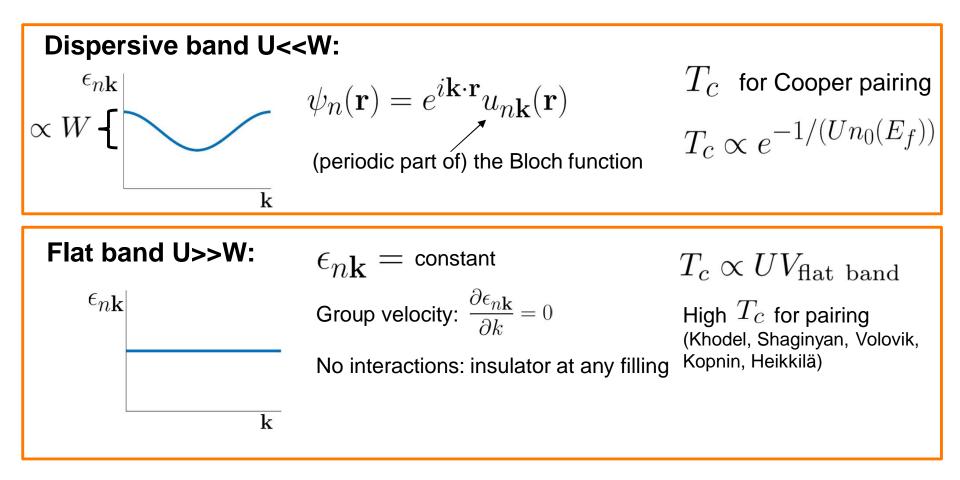

Superconductivity: BEC of Cooper pairs

Weak interaction U Large kinetic energy (Fermi level) Low critical temperature

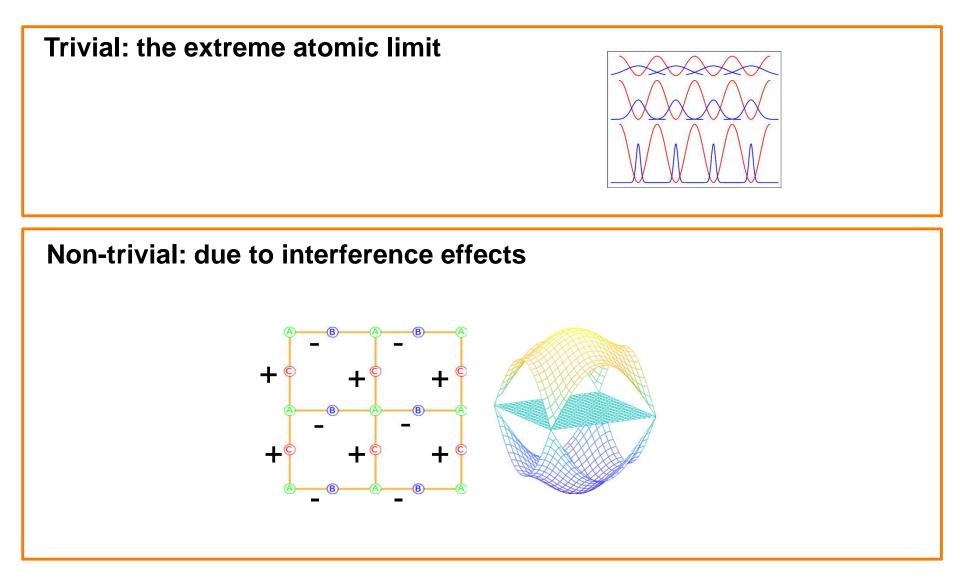

$$T_c \propto e^{-1/(Un_0(E_f))}$$

Remove the kinetic energy to maximize the effect of interactions!

Flat bands: interactions dominate

Flat bands

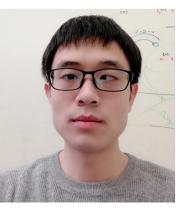

But is supercurrent stable at a flat band?

Supercurrent density: given by superfluid
weight and Cooper pair momentum
$$\mathbf{J} = \frac{1}{4} D_s \hbar \mathbf{q}$$
Conventional BCS: $D_s = \frac{n_{\rm p}}{m_{\rm eff}} \left(1 - \left(\frac{2\pi\Delta}{k_{\rm B}T}\right)^{1/2} e^{-\Delta/(k_{\rm B}T)} \right)$
Zero at a flat
band!!!
$$\frac{n_{\rm p}}{m_{\rm eff}} \propto J \propto \partial_{k_i} \partial_{k_j} \epsilon_{\mathbf{k}}$$
Bandwidth
 $i, j = x, y, z$

Superfluidity and quantum geometry

Our multiband approach

MULTIBAND BCS MEAN-FIELD THEORY multiband two-component attractive Fermi-Hubbard model -U < 0

$$H = -\sum_{ij\alpha\beta\sigma} t^{\sigma}_{i\alpha j\beta} c^{\dagger}_{i\alpha\sigma} c_{j\beta\sigma} - U \sum_{i\alpha} n_{i\alpha\uparrow} n_{i\alpha\downarrow} - \mu \sum_{i\alpha\sigma} n_{i\alpha\sigma}$$

Introduce a modulation of the order parameter phase to generate supercurrent

$$\Delta({f r}) o \Delta({f r}) e^{2i{f q}\cdot{f r}} = 2{f q}$$
 : Cooper pair momentum

$$\begin{bmatrix} D_s \end{bmatrix}_{ij} \propto \left. \frac{\partial^2 \Omega}{\partial q_i \partial q_j} \right|_{\mathbf{q}=0} \qquad \begin{array}{l} \mathbf{j}(\mathbf{q},\omega) = K(\mathbf{q},\omega) \mathbf{A}(\mathbf{q},\omega) \\ D_s = \lim_{\mathbf{q} \to 0} K(\mathbf{q},\omega=0) \end{array}$$

Superfluid weight in a multiband system

$$\begin{split} D_s &= D_{s, \text{conventional}} + D_{s, \text{geometric}} \\ &\propto \partial_{k_i} \partial_{k_j} \epsilon_{\mathbf{k}} \end{split} \quad & \text{Can be nonzero also in a flat band} \\ &\text{Present only in a multiband case} \\ &\text{Proportional to the quantum metric} \end{split}$$

 $[D_{s,\text{geometric}}]_{ij} \propto Ug_{ij}$

Quantum geometric tensor

Metric for the distance between quantum states

$$d\ell^{2} = ||u(\mathbf{k} + d\mathbf{k}) - u(\mathbf{k})||^{2} = \langle u(\mathbf{k} + d\mathbf{k}) - u(\mathbf{k})|u(\mathbf{k} + d\mathbf{k}) - u(\mathbf{k})\rangle$$

$$\approx \sum_{i,j} \langle \partial_{k_{i}} u | \partial_{k_{j}} u \rangle dk_{i} dk_{j}$$
Introduce gauge invariant version $(u(\mathbf{k}) \leftrightarrow u(\mathbf{k})e^{i\phi(\mathbf{k})})$

$$\Rightarrow \mathsf{Quantum geometric tensor}$$

$$\begin{aligned} \mathcal{B}_{ij}(\mathbf{k}) &= 2 \langle \partial_{k_i} u | (1 - |u\rangle \langle u|) | \partial_{k_j} u \rangle \\ \operatorname{Re} \mathcal{B}_{ij} &= g_{ij} \qquad \text{quantum metric } d\ell^2 = \sum_{ij} g_{ij} dk_i dk_j \\ \operatorname{Im} \mathcal{B}_{ij} &= [\mathbf{\Omega}_{\text{Berry}}]_{ij} \text{ Berry curvature} \end{aligned}$$

Provost, Vallee, Comm. Math. Phys. 76, 289 (1980)

Quantum metric is the same as Fubini-Study metric, and related to Fisher information

Lower bound for flat band superfluidity

The quantum geometric tensor \mathcal{B}_{ij} is complex positive semidefinite

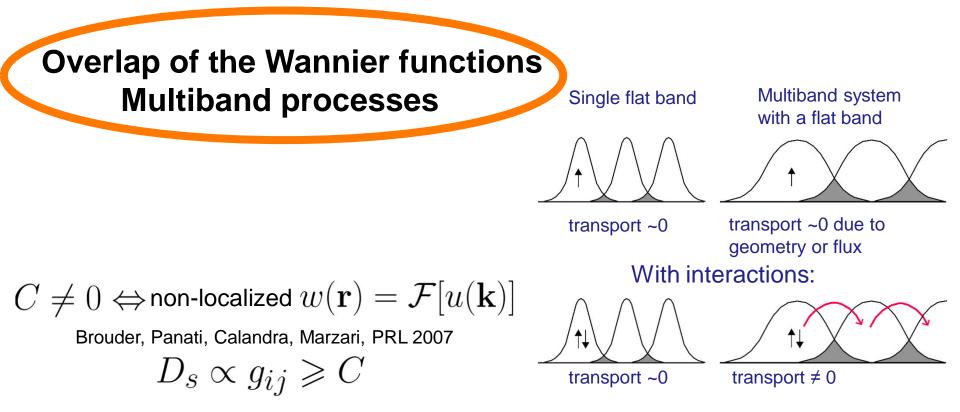

$$\Rightarrow D_s \geqslant \int_{B.Z.} d^d \mathbf{k} |\mathbf{\Omega}_{\text{Berry}}(\mathbf{k})| \geqslant C$$

Berry curvature:
$$\Omega(\mathbf{k}) = i\hat{z} \cdot \nabla \times \langle u_{n\mathbf{k}} | \partial_{\mathbf{k}} u_{n\mathbf{k}} \rangle$$

Chern number: $C = \frac{1}{2\pi} \int_{B.Z.} d^2 \mathbf{k} \ \Omega(\mathbf{k})$

Mean-field results confirmed by: exact diagonalization, DMFT, DMRG, perturbation theory

Why can there be transport in a flat band?

Twisted bilayer graphene (TBG) superconductivity and quantum metric

February 24, 2020 • Physics 13, 23

Three papers connect the superconducting transition temperature of a graphene-based material to the geometry of its electronic wave functions.

APS/Alan Stonebrake

Figure 1: Electrons moving through the sheets of twisted bilayer graphene (TBG) have special points in their band structure where two cone-shaped bands meet. The inherent "curvature" of the states in these bands turns out to contribute to the magnitude of TBG'... Show more

On its own, a sheet of graphene is a semimetal—its electrons interact only weakly with each other. But as experimentalists discovered in 2018 [1, 2], the situation changes when two sheets of graphene are stacked together, with a slight ($\sim 1^{\circ}$) rotation between them (Fig. 1). At this so-called magic twist angle [3] and at low temperatures [1], the electrons become correlated, forming insulating or superconducting phases depending on the carrier density [2–7]. These phases appear to come from a twist-induced flattening of the electronic energy bands, which
