

Form Factors of the Nucleon Axial and Pseudoscalar Currents

Chen Chen University of Giessen

Non-Perturbative QCD:

- Hadrons, as bound states, are dominated by non-perturbative QCD dynamics – <u>Two emergent phenomena</u>
 - > Confinement: Colored particles have never been seen isolated
 - > Explain how quarks and gluons bind together
 - **DCSB**: Hadrons do not follow the chiral symmetry pattern
 - Explain the most important mass generating mechanism for visible matter in the Universe
 - Neither of these phenomena is apparent in QCD 's Lagrangian, HOWEVER, They play a dominant role in determining the characteristics of <u>real-world QCD</u>!

Non-Perturbative QCD:

- From a quantum field theoretical point of view, these emergent phenomena could be associated with dramatic, dynamically driven changes in the analytic structure of QCD 's Schwinger functions (propagators and vertices). The Schwinger functions are solutions of the quantum equations of motion (Dyson-Schwinger equations).
- The Gap equation of the dressed-quark propagator:

Baryons: Faddeev equation

Non-Perturbative QCD:

Form Factors

- Form factors: contain important information about the structure and the properties of hadrons.
- Different probes correspond to different form factors.
- > The nucleon electromagnetic current: electromagnetic form factors

$$J^{\rm EM}_{\mu}(K,Q) = \bar{u}(P_f) \left[\gamma_{\mu} F_1(Q^2) + \frac{1}{2m_N} \sigma_{\mu\nu} Q_{\nu} F_2(Q^2) \right] u(P_i)$$

- A large number of experimental measurements, with high precision and up to large momentum transfer.
- The nucleon axial-vector current: axial-vector form factors

$$J_{5\mu}^{j}(K,Q) = \bar{u}(P_{f})\frac{\tau^{j}}{2}\gamma_{5}\left[\gamma_{\mu}G_{A}(Q^{2}) + i\frac{Q_{\mu}}{2m_{N}}G_{P}(Q^{2})\right]u(P_{i})$$

- The measurements are much more difficult, since they are related to weak processes.
- GA axial form factor: experimental data are rather sparse and with large uncertainties.
- *GP* induced pseudoscalar form factor: ONLY 4 empirical results.
- > The nucleon pseudoscalar current: pseudoscalar form factor

$$J_5^j(K,Q) = \bar{u}(P_f) \frac{\tau^j}{2} \gamma_5 G_5(Q^2) u(P_i)$$

> The Partially Conservation of the Axial Current (PCAC) relation:

$$G_A(Q^2) - \frac{Q^2}{4m_N^2}G_P(Q^2) = \frac{m_q}{m_N}G_5(Q^2)$$

> In the quark-diquark framework, the associated symmetry-preserving current:

Nucleon axial and pseudoscalar form factors from the covariant Faddeev equation

Gernot Eichmann and Christian S. Fischer Institut für Theoretische Physik, Justus-Liebig-Universität Giessen, D-35392 Giessen, Germany (Dated: November 2, 2018)

We compute the axial and pseudoscalar form factors of the nucleon in the Dyson-Schwinger approach. To this end, we solve a covariant three-body Faddeev equation for the nucleon wave function and determine the matrix elements of the axialvector and pseudoscalar isotriplet currents. Our only input is a well-established and phenomenologically successful ansatz for the nonperturbative quark-gluon interaction. As a consequence of the axial Ward-Takahashi identity that is respected at the quark level, the Goldberger-Treiman relation is reproduced for all current-quark masses. We discuss the timelike pole structure of the quark-antiquark vertices that enters the nucleon matrix elements and determines the momentum dependence of the form factors. Our result for the axial charge underestimates the experimental value by 20 - 25% which might be a signal of missing pion-cloud contributions. The axial and geavedoscalar form factors agree with phenomenological and lattice data in the momentum mage above $Q^2 \sim 1...2$ GeV².

I. INTRODUCTION

arXiv:1111.2614v1 [hep-ph] 10 Nov 2011

The nucleon's axial and pseudoscalar form factors are of fundamental significance for the properties of the nucleon that are probed in weak interaction processes. Their momentum dependence can be experimentally tested by (anti)neutino scattering off nucleons or nuclei, charged pion electroproduction and muon capture processes; see [1–3] for reviews. Both form factors are experimentally hard to extract and therefore considerably less well known than their electromagnetic counterparts. Precisely measured is only the low-momentum limit g_A of the axial form factor which is determined from neutron β -decay. Planned experiments at major facilities are expected to change this situation in the near future. The theoretical calculation of the nucleon's axial

and pseudoscalar form factors requires genuinely non-

perturbative methods. Chiral perturbation theory has

been successful in this respect [1, 4, 5] although it is gen-

erally limited to the region of low momentum transfer.

Recent studies in lattice gauge theory are getting closer

to the physical pion mass region [6-8] but finite-volume

effects become increasingly important. Another non-

perturbative approach is the one via functional meth-

The study of axial and pseudoscalar form factors in the functional approach has so far been limited to an approximation where the nucleon is treated as a bound object of a quark and a diquark that interact via quark exchange [12, 13]. The entire gluonic substructure appears here only implicitly within the dressing of quark and diquark propagators as well as diquark vertex functions. There are several conceptual issues that complicate the treatment of form factors in the quark-diquark model. First, the requirement of current conservation induces the appearance of intricate 'seagull' diagrams [14]. Such terms have been taken into account for electromagnetic form factors, but their implementation in the case of axial form factors has not yet been possible for technical reasons [13]. Second, to comply with chiral Ward identities, a current-conserving quark-diquark model requires vector diquarks in addition to the usual scalar and axialvector diquark degrees of freedom [15]. Such an elaborate treatment of the quark-diquark model has not yet been performed.

The situation is somewhat different when the nucleon is treated as a genuine three-body problem. The resulting Faddeev equation in rainbow-ladder truncation has been solved only recently for the nucleon and Δ measure [16, 17] and the compensations under determine the second sec

Numerical Results

The axial current – GA & GP

$$J_{5\mu}^{j}(K,Q) = \bar{u}(P_{f})\frac{\tau^{j}}{2}\gamma_{5}\left[\gamma_{\mu}G_{A}(Q^{2}) + i\frac{Q_{\mu}}{2m_{N}}G_{P}(Q^{2})\right]u(P_{i})$$

Two form factors:

• *G_A* – *axial form* factor

The axial current – GA & GP

$$J_{5\mu}^{j}(K,Q) = \bar{u}(P_{f})\frac{\tau^{j}}{2}\gamma_{5}\left[\gamma_{\mu}G_{A}(Q^{2}) + i\frac{Q_{\mu}}{2m_{N}}G_{P}(Q^{2})\right]u(P_{i})$$

Two form factors:

- GA axial form factor
- *G_P induced pseudoscalar* form factor

> The nucleon's induced pseudoscalar charge: $g_p^* = \frac{m_\mu}{2m_N}G_P(Q^2 = 0.88m_\mu^2)$

> Pion pole dominance (PPD) approximation: $G_P(x) \approx \frac{4}{x + m_{\pi}^2/m_N^2} G_A(x)$

The pseudoscalar current – G5

$$J_5^j(K,Q) = \bar{u}(P_f) \frac{\tau^j}{2} \gamma_5 G_5(Q^2) u(P_i)$$

One form factor:

• G₅ – pseudoscalar form factor

The pseudoscalar current – G5 & GπNN

$$J_5^j(K,Q) = \bar{u}(P_f) \frac{\tau^j}{2} \gamma_5 G_5(Q^2) u(P_i)$$

- One form factor:
 - G5 pseudoscalar form factor
- At the pion mass pole, the residue of *G*⁵ is the pion-nucleon coupling constant $g_{\pi NN}$. Thus one can define the *pion-nucleon* form factor $G_{\pi NN}$: $G_5(Q^2) =: \frac{m_{\pi}^2}{Q^2 + m_{\pi}^2} \frac{f_{\pi}}{m_q} G_{\pi NN}(Q^2)$ $G_{\pi NN}(Q^2 = -m_{\pi}^2) = g_{\pi NN}$
- The Goldberger-Treiman relation:

$$G_A(0) = \frac{f_\pi}{m_N} G_{\pi NN}(0)$$

The Goldberger-Treiman discrepancy (measures the distance from the chiral limit):

$$\Delta_{\rm GT} = 1 - \frac{G_A(0)}{\frac{f_\pi}{m_\pi} G_{\pi NN}(-m_\pi^2)} = 1 - \frac{G_{\pi NN}(0)}{G_{\pi NN}(-m_\pi^2)}$$

The pseudoscalar current – $G_5 \& G_{\pi NN}$

$$J_5^j(K,Q) = \bar{u}(P_f) \frac{\tau^j}{2} \gamma_5 G_5(Q^2) u(P_i)$$

- One form factor:
 - G5 pseudoscalar form factor
- At the pion mass pole, the residue of *G*⁵ constant $g_{\pi NN}$. Thus one can define the μ $G_5(Q^2) =: \frac{m_{\pi}^2}{Q^2 + m_{\pi}^2} \frac{f_{\pi}}{m_q} G_{\pi NN}(Q^2)$ $G_{\pi NN}(Q^2 = -m_{\pi}^2) = g_{\pi NN}$
- The Goldberger-Treiman relation:

$$G_A(0) = \frac{f_\pi}{m_N} G_{\pi NN}(0)$$

The Goldberger-Treiman discrepancy (m chiral limit):

$$\Delta_{\rm GT} = 1 - \frac{G_A(0)}{\frac{f_\pi}{m_\pi} G_{\pi NN}(-m_\pi^2)} = 1 - \frac{G_{\pi NN}(0)}{G_{\pi NN}(-m_\pi^2)}$$

PCAC

The Partially Conservation of the Axial Current (PCAC) relation:

$$G_A(Q^2) - \frac{Q^2}{4m_N^2}G_P(Q^2) = \frac{m_q}{m_N}G_5(Q^2)$$

Define: the PCAC ratio

$$R_{\rm PCAC} := \frac{4m_N^2 G_A}{Q^2 G_P + 4m_q m_N G_5}$$

D. Proof of PCAC

We have specified all the necessary building blocks to construct the diagrams of $J_{5\mu}^{j}(K,Q)$ and $J_{5}^{j}(K,Q)$ depicted in Fig. 3, with the corresponding expressions given in Appendix B. Before we perform numerical computations, it is important to prove analytically the PCAC relation, Eq. (7), *i.e.* $J_{5\mu}^{j}(K,Q)$ and $J_{5}^{j}(K,Q)$ are both a sum of six terms (listed in Fig. 3):

$$J_{5(\mu)}^{j} = J_{5(\mu)}^{q} + J_{5(\mu)}^{dq,aa} + (J_{5(\mu)}^{dq,sa} + J_{5(\mu)}^{dq,as}) + J_{5(\mu)}^{ex} + J_{5(\mu)}^{sg} + J_{5(\mu)}^{\overline{sg}}.$$
(68)

Note too that, in this proof, we shall consider either the neutral (τ^3) or the charged $(\tau^{1\pm i2})$ currents; in the isospin limit, their flavor coefficients are precisely the same.

Diagram 1: current coupling to quark line

For Diagram 1 in Fig. 3, contracting Eq. (B.2) with Q_{μ} and using Eq. (17), we obtain³

$$Q_{\mu}J_{5\mu}^{q,0^{+}}(K,Q) + 2im_{q}J_{5}^{q,0^{+}}(K,Q)$$

= $\frac{1}{2}\int_{p} \bar{\Psi}^{0^{+}}(p_{f}';-P_{f}) S(p_{q+}) [Q_{\mu}\Gamma_{5\mu}(p_{q+},p_{q-})+$

PCAC

The Partially Conservation of the Axial Current (PCAC) relation:

$$G_A(Q^2) - \frac{Q^2}{4m_N^2}G_P(Q^2) = \frac{m_q}{m_N}G_5(Q^2)$$

Define: the PCAC ratio

$$R_{\rm PCAC} := \frac{4m_N^2 G_A}{Q^2 G_P + 4m_q m_N G_5}$$

$$Q_{\mu}J_{5\mu}^{\overline{sg},1^{+}1^{+}} + 2im_{q}J_{5}^{\overline{sg},1^{+}1^{+}} = \int_{p}\int_{k} \bar{\Phi}_{\alpha,f}^{1^{+}} \left[(\frac{1}{12})\Gamma_{\beta}^{1^{+}}(\tilde{k}_{r})S^{\mathrm{T}}(\tilde{q})\bar{\Gamma}_{\alpha}^{1^{+}}(\tilde{p}_{r})i\gamma_{5} + (-\frac{5}{12})\Gamma_{\beta}^{1^{+}}(\tilde{k}_{r})S^{\mathrm{T}}(\tilde{q})i\gamma_{5}^{\mathrm{T}}\bar{\Gamma}_{\alpha}^{1^{+}}(\tilde{p}_{r}') \right] \Phi_{\beta,i}^{1^{+}}; \qquad (95)$$

The color/flavor coefficients in the first lines of Eqs. (92)-(95) are calculated via Eq. (C.10), *i.e.* the bystander legs of the seagulls' conjugations; and the coefficients in the second lines are calculated via Eq. (C.9), the exchange legs.

Sum of all contributions

Using Eqs. (68), (73), (78), (79), (80), (81), (86) and (91), it is straightforward to obtain their sum:

$$Q_{\mu}J_{5\mu}^{j}(K,Q) + 2im_{q}J_{5}^{j}(K,Q) = \sum_{J_{1}^{P_{1}},J_{2}^{P_{2}}=0^{+},1^{+}} \left[\left(Q_{\mu}J_{5\mu}^{q,J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) + 2im_{q}J_{5}^{q,J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) \right) + \left(Q_{\mu}J_{5\mu}^{\mathrm{ex},J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) + 2im_{q}J_{5}^{\mathrm{ex},J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) \right) + \left(Q_{\mu}J_{5\mu}^{\mathrm{sg},J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) + 2im_{q}J_{5}^{\mathrm{sg},J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) \right) + \left(Q_{\mu}J_{5\mu}^{\mathrm{sg},J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) + 2im_{q}J_{5}^{\mathrm{sg},J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) \right) + \left(Q_{\mu}J_{5\mu}^{\mathrm{sg},J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) + 2im_{q}J_{5}^{\mathrm{sg},J_{1}^{P_{1}}J_{2}^{P_{2}}}(K,Q) \right) \right] = 0, \qquad (96)$$

where j = 3 for the neutral current, or $j = 1 \pm i2^{2}$ for the charged currents.

Summary & Perspective

- Solved the seagull term problem for the axial and pseudoscalar currents, which had defied our understanding for more than 20 years.
- **Computed the form factors GA**, **GP** and **G5**.
- > The PCAC relation can be satisfied precisely.
- > Next:
 - **Compute the axial Delta->Delta, N-> Delta, N->Roper...**
 - In the three-body framework, revisiting the computation of Eichmann & Fischer (2011) first.

Building blocks (I)

- > The current-quark vertices
 - The axial-vector Ward-Takahashi identity:

$$Q_{\mu}\Gamma^{j}_{5\mu}(k_{+},k_{-}) + 2im_{q}\Gamma^{j}_{5}(k_{+},k_{-}) = S^{-1}(k_{+})i\gamma_{5}\frac{\tau^{j}}{2} + \frac{\tau^{j}}{2}i\gamma_{5}S^{-1}(k_{-})$$

• The Bethe-Salpeter Amplitude of the pion:

$$\Gamma^j_{\pi}(k,Q) = \tau^j \gamma_5 \left[iE_{\pi}(k,Q) \right]$$

• One Ansatz:
$$E_{\pi}(k,Q) = \frac{1}{2f_{\pi}} \left(B(k_{+}^{2}) + B(k_{-}^{2}) \right)$$

 $S^{-1}(k) = i\gamma \cdot kA(k^{2}) + B(k^{2})$
in the chiral limit:
 $E_{\pi}(k,0) = \frac{B(k^{2})}{f_{\pi}}$
 $= 2i\frac{Q_{\mu}}{Q^{2} + m_{\pi}^{2}} \Sigma_{B}(k_{+}^{2},k_{-}^{2}) + 2\gamma \cdot kk_{\mu}\Delta_{A}(k_{+}^{2},k_{-}^{2})$
 $+ 2i\frac{Q_{\mu}}{Q^{2} + m_{\pi}^{2}} \Sigma_{B}(k_{+}^{2},k_{-}^{2}) \right],$ (28)

and

The axial current – GA & GP

$$J_{5\mu}^{j}(K,Q) = \bar{u}(P_{f})\frac{\tau^{j}}{2}\gamma_{5}\left[\gamma_{\mu}G_{A}(Q^{2}) + i\frac{Q_{\mu}}{2m_{N}}G_{P}(Q^{2})\right]u(P_{i})$$

Two form factors:

- GA axial form factor
- *G_P induced pseudoscalar* form factor

> The nucleon's induced pseudoscalar charge: $g_p^* = \frac{m_\mu}{2m_N}G_P(Q^2 = 0.88m_\mu^2)$

> Pion pole dominance (PPD) approximation: $G_P(x) \approx \frac{4}{x + m_\pi^2/m_N^2} G_A(x)$

Fractions of *G^A*(0), *G^P*(0) and *G⁵*(0)

TABLE I. Referring to Fig. 3, separation of $G_A(0)$, $G_P(0)$ and $G_5(0)$ into contributions from various diagrams, listed as a fraction of the total $Q^2 = 0$ value. Diagram (1): $\langle J \rangle_q^S$ weak-boson strikes dressed-quark with scalar diquark spectator; and $\langle J \rangle_q^A -$ weak-boson strikes dressed-quark with axialvector diquark spectator. Diagram (2): $\langle J \rangle_{qq}^{AA}$ – weak-boson interacts strikes axial-vector diquark with dressed-quark spectator. Diagram (3): $\langle J \rangle_{dq}^{SA+AS}$ – weak-boson mediates transition between scalar and axial-vector diquarks, with dressedquark spectator. Diagram (4): $\langle J \rangle_{ex}$ – weak-boson strikes dressed-quark "in-flight" between one diquark correlation and another. Diagrams (5) and (6): $\langle J \rangle_{sg}$ – weak-boson couples inside the diquark correlation amplitude. The listed uncertainty in these results reflects the impact of $\pm 5\%$ variations in the diquark masses in Eq. (16), e.g. $0.71_{1\mp} \Rightarrow 0.71 \mp 0.01$.

	$\langle J \rangle_{\rm q}^S$	$\langle J \rangle_{\rm q}^A$	$\langle J \rangle_{\rm qq}^{AA}$	$\langle J \rangle_{\rm qq}^{SA+AS}$	$\langle J \rangle_{\rm ex}$	$\langle J \rangle_{\rm sg}$
$G_A(0)$	$0.71_{4_{\mp}}$	$0.064_{2\pm}$	$0.025_{5\pm}$	0.13 ₀ _∓	$0.072_{32\pm}$	0
$G_P(0)$	$0.74_{4_{\mp}}$	$0.070_{5\pm}$	$0.025_{5\pm}$	0.13 ₀ _∓	$0.22_{4\pm}$	$-0.19_{1_{\mp}}$
$G_{5}(0)$	$0.74_{4_{\mp}}$	$0.069_{5\pm}$	$0.025_{5\pm}$	$0.13_{0_{\mp}}$	$0.22_{4\pm}$	$-0.19_{1_{\mp}}$

$$G_A = -\frac{1}{4(1+\tau)} \operatorname{tr}_{\mathrm{D}}[J_{5\mu}\gamma_5\gamma_{\mu}^T],$$

$$G_P = \frac{1}{\tau} \left(G_A - \frac{Q_{\mu}}{4im_N\tau} \operatorname{tr}_{\mathrm{D}}[J_{5\mu}\gamma_5] \right),$$

$$G_5 = \frac{1}{2\tau} \operatorname{tr}_{\mathrm{D}}[J_5\gamma_5],$$

 $\succ \quad G_P(\mathbf{0}) \sim G_5(\mathbf{0})$ $G_P \sim \frac{Q_\mu}{\tau^2} \operatorname{tr}_D \left[J_{5\mu} \gamma_5 \right] \sim \frac{1}{\tau} \operatorname{tr}_D \left[J_5 \gamma_5 \right] \sim G_5 ,$ when $Q^2 \sim 0 \operatorname{GeV}^2$.

The dressed-quark propagator

 $S(p) = -i\gamma \cdot p\sigma_V(p^2) + \sigma_S(p^2)$

> algebraic form:

$$\bar{\sigma}_{S}(x) = 2\bar{m}\mathcal{F}(2(x+\bar{m}^{2})) + \mathcal{F}(b_{1}x)\mathcal{F}(b_{3}x)[b_{0}+b_{2}\mathcal{F}(\epsilon x)], \quad (A3a)$$

$$\bar{\sigma}_V(x) = \frac{1}{x + \bar{m}^2} [1 - \mathcal{F}(2(x + \bar{m}^2))],$$
 (A3b)

with
$$x = p^2/\lambda^2$$
, $\bar{m} = m/\lambda$,

$$\mathcal{F}(x) = \frac{1 - e^{-x}}{x},\tag{A4}$$

 $\bar{\sigma}_S(x) = \lambda \sigma_S(p^2)$ and $\bar{\sigma}_V(x) = \lambda^2 \sigma_V(p^2)$. The mass scale, $\lambda = 0.566$ GeV, and parameter values,

$$\frac{\bar{m}}{0.00897} \frac{b_0}{0.131} \frac{b_1}{2.90} \frac{b_2}{0.603} \frac{b_3}{0.185}, \quad (A5)$$

associated with Eq. (A3) were fixed in a least-squares fit to light-meson observables [79,80]. [$\epsilon = 10^{-4}$ in Eq. (A3a) acts only to decouple the large- and intermediate- p^2 domains.] 34

The dressed-quark propagator

 $S(p) = -i\gamma \cdot p\sigma_V(p^2) + \sigma_S(p^2)$

- Based on solutions to the gap equation that were obtained with a dressed gluon-quark vertex.
- Mass function has a real-world value at p² = 0, NOT the highly inflated value typical of RL truncation.
- Propagators are entire functions, consistent with sufficient condition for confinement and completely unlike known results from RL truncation.
- Parameters in quark propagators were fitted to a diverse array of meson observables.
 ZERO parameters changed in study of baryons.
- Compare with that computed using the DCSB-improved gap equation kernel (DB).
 The parametrization is a sound representation numerical results, although simple and introdu long beforehand.

FIG. 6. Solid curve (blue)—quark mass function generated by the parametrization of the dressed-quark propagator specified by Eqs. (A3) and (A4) (A5); and band (green)—exemplary range of numerical results obtained by solving the gap equation with the modern DCSB-improved kernels described and ³⁵used in Refs. [16,81–83].

- Diquark amplitudes: five types of correlation are possible in a J=1/2 bound state: isoscalar scalar(I=0,J^P=0^+), isovector pseudovector, isoscalar pseudoscalar, isoscalar vector, and isovector vector.
- The LEADING structures in the correlation amplitudes for each case are, respectively (Dirac-flavor-color),

$$\Gamma^{0^{+}}(k;K) = g_{0^{+}} \gamma_5 C \tau^2 \vec{H} \mathcal{F}(k^2/\omega_{0^{+}}^2),$$

$$\vec{\Gamma}^{1^+}_{\mu}(k;K) = ig_{1^+}\gamma_{\mu}C\vec{t}\vec{H}\mathcal{F}(k^2/\omega_{1^+}^2),$$

 $\Gamma^{0^{-}}(k;K) = ig_{0^{-}}C\tau^{2}\vec{H}\mathcal{F}(k^{2}/\omega_{0^{-}}^{2}),$

$$\Gamma_{\mu}^{1-}(k;K) = g_{1-}\gamma_{\mu}\gamma_{5}C\tau^{2}\vec{H}\mathcal{F}(k^{2}/\omega_{1-}^{2}),$$

$$\vec{\Gamma}_{\mu}^{\bar{1}^-}(k;K) = ig_{\bar{1}^-}[\gamma_{\mu},\gamma\cdot K]\gamma_5 C\vec{t}\vec{H}\mathcal{F}(k^2/\omega_{\bar{1}^-}^2),$$

- Simple form. Just one parameter: diquark masses.
- Match expectations based on solutions of meson and diquark Bethe-Salpeter amplitudes.

The diquark propagators

$$\Delta^{0^{\pm}}(K) = \frac{1}{m_{0^{\pm}}^2} \mathcal{F}(k^2/\omega_{0^{\pm}}^2),$$

$$\Delta_{\mu\nu}^{1^{\pm}}(K) = \left[\delta_{\mu\nu} + \frac{K_{\mu}K_{\nu}}{m_{1^{\pm}}^{2}}\right] \frac{1}{m_{1^{\pm}}^{2}} \mathcal{F}(k^{2}/\omega_{1^{\pm}}^{2}).$$

The *F-functions*: Simplest possible form that is consistent with infrared and ultraviolet constraints of confinement (IR) and 1/q^2 evolution (UV) of meson propagators.

> Diquarks are confined.

- free-particle-like at spacelike momenta
- pole-free on the timelike axis
- This is NOT true of RL studies. It enables us to reach arbitrarily high values of momentum transfer.

> The Faddeev ampitudes:

$$\begin{split} \psi^{\pm}(p_{i},\alpha_{i},\sigma_{i}) &= [\Gamma^{0^{+}}(k;K)]_{\sigma_{1}\sigma_{2}}^{\alpha_{1}\alpha_{2}}\Delta^{0^{+}}(K)[\varphi_{0^{+}}^{\pm}(\ell;P)u(P)]_{\sigma_{3}}^{\alpha_{3}} \\ &+ [\Gamma^{1^{+}j}_{\mu}]\Delta^{1^{+}}_{\mu\nu}[\varphi_{1^{+}\nu}^{j\pm}(\ell;P)u(P)] \\ &+ [\Gamma^{0^{-}}]\Delta^{0^{-}}[\varphi_{0^{-}}^{\pm}(\ell;P)u(P)] \\ &+ [\Gamma^{1^{-}}_{\mu}]\Delta^{1^{-}}_{\mu\nu}[\varphi_{1^{-}\nu}^{\pm}(\ell;P)u(P)], \end{split}$$
(9)

> Quark-diquark vertices:

$$\begin{split} \varphi_{0^{\pm}}^{\pm}(\ell;P) &= \sum_{i=1}^{2} s_{i}^{\pm}(\ell^{2},\ell\cdot P) \mathcal{S}^{i}(\ell;P) \mathcal{G}^{\pm}, \\ \varphi_{1^{\pm}\nu}^{j\pm}(\ell;P) &= \sum_{i=1}^{6} \alpha_{i}^{j\pm}(\ell^{2},\ell\cdot P) \gamma_{5} \mathcal{A}_{\nu}^{i}(\ell;P) \mathcal{G}^{\pm}, \\ \varphi_{0^{\pm}}^{\pm}(\ell;P) &= \sum_{i=1}^{2} \mathcal{P}_{i}^{\pm}(\ell^{2},\ell\cdot P) \mathcal{S}^{i}(\ell;P) \mathcal{G}^{\mp}, \\ \varphi_{0^{\pm}\nu}^{\pm}(\ell;P) &= \sum_{i=1}^{2} \mathcal{P}_{i}^{\pm}(\ell^{2},\ell\cdot P) \mathcal{S}^{i}(\ell;P) \mathcal{G}^{\mp}, \\ \varphi_{1^{\pm}\nu}^{\pm}(\ell;P) &= \sum_{i=1}^{6} v_{i}^{\pm}(\ell^{2},\ell\cdot P) \mathcal{S}^{i}(\ell;P) \mathcal{G}^{\mp}, \\ \varphi_{1^{\pm}\nu}^{\pm}(\ell;P) &= \sum_{i=1}^{6} v_{i}^{\pm}(\ell^{2},\ell\cdot P) \gamma_{5} \mathcal{A}_{\nu}^{i}(\ell;P) \mathcal{G}^{\mp}, \end{split}$$
where $\mathcal{G}^{+(-)} = \mathbf{I}_{D}(\gamma_{5})$ and
 $\mathcal{S}^{1} &= \mathbf{I}_{D}, \qquad \mathcal{S}^{2} &= i\gamma \cdot \hat{\ell} - \hat{\ell} \cdot \hat{P} \mathbf{I}_{D}, \qquad \mathcal{A}_{\nu}^{3} &= \gamma \cdot \hat{\ell}^{\pm} \hat{\ell}_{\nu}^{\pm} \mathcal{A}_{\nu}^{4}, \\ \mathcal{A}_{\nu}^{4} &= i\hat{\ell}_{\nu}^{\pm} \mathbf{I}_{D}, \qquad \mathcal{A}_{\nu}^{2} &= -i\hat{P}_{\nu} \mathbf{I}_{D}, \qquad \mathcal{A}_{\nu}^{6} &= i\gamma_{\nu}^{\pm} \gamma \cdot \hat{\ell}^{\pm} - \mathcal{A}_{\nu}^{4}, \\ \varphi_{1^{\pm}\nu}^{\pm}(\ell;P) &= \sum_{i=1}^{6} v_{i}^{\pm}(\ell^{2},\ell\cdot P) \gamma_{5} \mathcal{A}_{\nu}^{i}(\ell;P) \mathcal{G}^{\mp}, \end{aligned}$

- Both the Faddeev amplitude and wave function are Poincare covariant, i.e. they are qualitatively identical in all reference frames.
- Each of the scalar functions that appears is frame independent, but the frame chosen determines just how the elements should be combined.
- In consequence, the manner by which the dressed quarks' spin, S, and orbital angular momentum, L, add to form the total momentum J, is frame dependent: L, S are not independently Poincare invariant.
- > The set of baryon rest-frame quark-diquark angular momentum identifications:

²S:
$$S^{1}$$
, \mathcal{A}_{ν}^{2} , $(\mathcal{A}_{\nu}^{3} + \mathcal{A}_{\nu}^{5})$,
²P: S^{2} , \mathcal{A}_{ν}^{1} , $(\mathcal{A}_{\nu}^{4} + \mathcal{A}_{\nu}^{6})$,
⁴P: $(2\mathcal{A}_{\nu}^{4} - \mathcal{A}_{\nu}^{6})/3$,
⁴D: $(2\mathcal{A}_{\nu}^{3} - \mathcal{A}_{\nu}^{5})/3$,

The scalar functions associated with these combinations of Dirac matrices in a Faddeev wave function possess the identified angular momentum correlation between the quark and diquark.

Quark-diquark picture

- A baryon can be viewed as a Borromean bound-state, the binding within which has two contributions:
 - ✓ Formation of tight diquark correlations.
 - ✓ Quark exchange depicted in the shaded area.

- The exchange ensures that diquark correlations within the baryon are fully dynamical: no quark holds a special place.
- The rearrangement of the quarks guarantees that the baryon's wave function complies with Pauli statistics.
- Modern diquarks are different from the old static, point-like diquarks which featured in early attempts to explain the so-called missing resonance problem.
- The number of states in the spectrum of baryons obtained is similar to that found in the three-constituent quark model, just as it is in today's LQCD calculations.
